The annual report for 1936 of the National Association for Supplying Medical Aid by Women to the Women of India, comprising the original Countess of Dufferin's Fund, the Women's Medical Service, and the Central Office, contains a reference to the rebuilding of the Dufferin Hospital in Calcutta, which will involve the provision of better conditions for the housing and training of nurses Grants from the Silver Jubilee Fund are being used for this purpose, and also for the improvement of the Dufferin hospitals at Vizagapatam and Karachi The Dufferin Hospital at Amraoti is to be rebuilt on a new and better site A biochemistry department has been opened at the Lady Hardinge Medical College, New Delhi, in close association with the pathology department, and the most urgent need there now is a new pharmacology section, though the College is still cramped for quarters for senior and assistant members of the staff and for office and store accommodation Classroom and museum space could also be advantageously extended if funds permitted Better organization of the out-patient department is necessary, and also specialization of the eye, ear, nose, and throat department Women s hospitals in Delhi have too few maternity beds, a distressing sequel to the attempts which have been made for some years to popularize institutional treatment of obstetrical cases A new maternity block is urgently needed, and extension of the children s ward and the *x*-ray department is highly desirable An increase in the influx of maternity cases is also reported from other hospitals, including the Victoria Zenana Hospital, Delhi, the Lady Aitchison Hospital at Lahore, the Lady Sandeman Dufferin Hospital at Quetta, and similar institutions at Madras, Karachi, Calcutta, and elsewhere The Women's Medical School at Agra has expanded, but a septic midwifery block is still urgently needed, a preliminary training school for probationer nurses is being started The out-patient work is particularly heavy at Lucknow, the ante natal clinic is well attended, and every available inch of room on verandas and elsewhere is being used for in-patients The case statistics at the Lady Elgin and Crump Dispensary at Jubbulpore are the highest on record, and a new hospital for women and children is being envisaged despite the shortage of funds From many centres come reports of the difficulty experienced in training nurses owing to the poor general education of candidates, few can speak or understand English A new surgical block has been erected at Bettiah in the Province of Bihar and Orissa, the cost having been met locally The child welfare centre there is very popular and is doing excellent work, including the instruction of local dais Useful reconstruction has been effected at the Ganesh Das Hospital for Women and Children in Assam and help has been obtained from paying patients cheaper paying wards for Indian patients are still needed also an out-patient block separate from the main hospital building and an isolation room An account of the founding of the Countess of Dufferin s Fund and its subsequent progress has been published and circulated in India and the United Kingdom

Correspondence

Treatment of Psychoneuroses

SIR,—I was glad to read Dr Marion E Mackenzie s letter in the *Journal* of November 20 (*p* 1046) It is agreed on all hands that some 35 per cent *at least* of all sickness is of psychogenic origin, and yet this "third" of preventable economic loss to the country is left practically untreated

The psychological approach is still a tortuous byway without any guideposts It is still beset with rank grass, and will be till more venture on it The difficulty in treating the psychoneuroses is not merely owing to the lack of "clinics," though, as Dr Mackenzie says, this is deplorable, but rather is the difficulty inherent in the subject The only method known at present of treating these cases seriously is by some form of psychotherapy either suggestion, re-education, or reductive analysis, each one of which methods means a considerable expenditure of time The time factor at present is the insuperable barrier to anything like efficient treatment Each case must be dealt with individually by *one* practitioner over a period of many hours, probably something in the neighbourhood of 100

Several years ago an attempt was made in Sheffield to form an out-patient department for such cases, and though some benefit is derived from this—if only that the patients feel that someone is trying to help them—this effort at amelioration is largely stultified by the number of patients seeking treatment At present it is only possible to devote one half-day a week to the clinic, and with two of us working there for three hours it is only possible to deal with the mass of material presented in a superficial manner The best we can do is to pick out one or two cases who seem from their general survey to be most likely to react to and co operate with any attempt at psychotherapy, and to arrange for special interviews for these on other days With the amount of time at one s disposal it is clear that only about half a dozen patients can be so treated in the year by two men

When I say that on any single afternoon of the clinic as many as eight or nine new cases may be sent up, it is clear that, of the 400 cases thus seen per annum to be able to treat seriously only six is saddening The only solution to the problem is for the practitioner to treat his patients privately This is clearly the best solution The practitioner knows the family background, and so starts off with a great advantage over the specialist The only difficulty is lack of knowledge of psychological medicine, due to a complete absence of any teaching of this subject in most curricula Attempts are being made here and there to remedy this, but opposition is always met with, not perhaps active opposition that could be met and disposed of, but rather the opposition of refusal of interest by the Faculties

There are signs, however, of some improvement in this aspect of the question, and it is to be hoped that medical students in the near future will leave their schools with some knowledge of the mechanism of psychoneuroses, so far as this is known—and better still, may have their interest stimulated in a condition which is going to form so large a part of their future work —I am, etc,

E FRETSON SKINNER

Sheffield Dec 1

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager. Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary, B.M.A. House, Tavistock Square, W.C.1.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are:
EDITOR OF THE *BRITISH MEDICAL JOURNAL*, *Articulate, Westcent, London*.
SECRETARY, *Medisecra, Westcent, London*.

The address of the B.M.A. Scottish Office is 7 Drumsheugh Gardens, Edinburgh (telegrams *Associate, Edinburgh*; telephone 24361 Edinburgh); and of the Office of the Irish Free State Medical Union (I.M.A. and B.M.A.) 18 Kildare Street, Dublin (telegrams *Bacillus, Dublin*; telephone 62550 Dublin).

QUERIES AND ANSWERS

Incapacitating Diarrhoea

"EMDEE" writes: I would be grateful for advice as to treatment in my own case. For many years I have suffered from "morning diarrhoea" which is only relieved by a good dose of tinct. chlorof. et morph. co. or some similar compound. The motions are copious and a little slimy. There is another milder attack at 10 p.m. It is rare for sleep to be disturbed but I am awakened by general abdominal pain. Cold weather aggravates the condition. I had some trouble as a child but the condition was negligible until service in the East, during the Great War, caused me to be invalided for this condition. Every known examination has been made including liver tests, x rays and sigmoidoscopy, but the results are negative. My weight is normal, my colour good, alcohol I dislike and my diet is light and easily digestible. My only indulgence is in tobacco. There appears to be merely a copious exudation of fluid into the colon, since a recent period of residence in the Tropics reduced the trouble considerably and I associate this with continuous and profuse sweating. Bismuth bromides, arsenic, tannin, kaolin, and antiseptics are quite useless.

Generalized Psoriasis

"M.B., B.CH." writes: I would be grateful for suggestions as to the treatment of a case of generalized psoriasis. This appears regularly every autumn in an old lady aged 68. She has a chronic infective arthritis accompanying the psoriasis, which has improved considerably after gold injections. Is there anything I can give her in the late summer months to prevent a recurrence of the psoriasis, which always arises in November or December? Tar preparations seem of no avail. She has been on a fat-free diet for nine months with no improvement. Only sedatives and a soothing ointment seem to be of any value in the acute stage.

LETTERS, NOTES, ETC.

Subcutaneous Emphysema during Labour

Dr. W. J. GRAY (Glengall Hospital, Ayr) writes: A primigravida aged 27 went into labour at term. The nurse in attendance drew my attention to oedema of the eyelids. No crepitation could be elicited at that time but later in the second stage of labour, delayed in this case by a fair degree of rigidity of the perineum, the face assumed a very puffy appearance and the typical "crinkling" sensation could be appreciated. The patient delivered herself spontaneously. The emphysema gradually extended over the neck and chest. The pulse rate remained a trifle high despite a normal expulsion of the placenta. Twelve hours after delivery the temperature rose to 99.5° F. but settled shortly afterwards. The puerperium was quite normal otherwise.

*** A full account of a similar case appears in this issue of the *Journal* at p. 1169.—ED., *B.M.J.*

A Questionary on Sulphanilamide in Puerperal Sepsis

The December number of the *Practitioner* contains a symposium on sulphanilamide drugs. In an article on the assessment of the efficiency of chemotherapeutic substances Dr. Lionel E. H. Whitby makes the interesting suggestion that a questionary issued to men in general practice on the treatment of puerperal sepsis with sulphanilamide would provide material for a collated article of immense value. The *Practitioner* has, therefore, had the enterprise to follow up Dr. Whitby's suggestion by including in its December issue a loosely inset four-page questionary. The two questions on the first side of the leaflet are: (1) What is your average number of maternity cases per annum? (2) Have you experienced any cases of puerperal sepsis? If the answer to the second question is in the affirmative the reader is asked to fill in details of cases observed between January 1, 1928, and December 1, 1937, under the headings of septicaemia, peritonitis, and pelvic cellulitis. Additional copies of the questionary can be obtained post free on application to the *Practitioner* at its offices, 5 Bentinck Street, London, W.1. The result of such an inquiry should be of much interest and value if a sufficient number of medical men would agree to pool their experience. It is, perhaps, needless to say that any information supplied will be strictly confidential.

Disclaimer

Dr. J. SINCLAIR (Thornton Heath, Surrey) writes: May I disclaim responsibility for the publicity which I have received this week in the Press? I have a patient suffering from ulcerative endocarditis, the causal organism being the *Streptococcus viridans*. My attention was drawn to a newspaper cutting stating that a Canadian doctor was seeking a man who had recovered from an endocarditis. The name of one such man was quoted, but not his address. In view of the gravity of my patient's condition, and also of the fact that the man in question might be asked to go to Canada at a near date, I telephoned the newspaper on Sunday morning and asked for his address. This was not known but they gave me the address of Dr. Ross of Ilford who knew the man. I got in touch with Dr. Ross, and I learned from him that this patient had had an acute infection with *Streptococcus viridans* and had recovered. Dr. Ross very kindly offered to get the man to telephone me and I then waited to hear from him. To my surprise I had a telephone message on Sunday afternoon to say that the newspaper men had found the man I wanted and were bringing him to see me, which they did. I obtained his consent to be a donor for my patient. His blood was suitable and the transfusion was carried out at Croydon General Hospital. I realize now that it was too much to expect that the newspaper in question would be content with getting me in touch with Dr. Ross. I could not break faith with my patient by refusing to go on with the proposed transfusion and I could see no other way of avoiding a certain measure of newspaper comment. I did my best to keep it down, but those of your readers who have had experience of reporters will appreciate my difficulties.

A Practical Christmas Gift

There could be no more acceptable Christmas gift for a doctor than the Westric Car Battery Trickle Charger, produced by the Westinghouse Brake and Signal Company which will ensure that the battery to his car is kept charged and in good condition. The gadget, which is designed for A.C. mains, is easy to instal, simple to operate and needs no attention or renewals. It may be obtained complete with cable and special plug and socket for fitting to the dashboard for 75s.

William R. Warner and Co. Ltd. (Power Road, Chiswick, W.4) have sent us a copy of their *Calendar of Medical History* for 1938. It has been thoroughly revised and brought up to date and some new information has been added. Copies will be sent free on request to doctors residing in Great Britain and Northern Ireland.

Immunization against Typhoid

SIR,—The Croydon outbreak of typhoid fever has raised several important questions The bogy of the negative phase" has again appeared I am not aware of any clinical evidence in support of the view that the occurrence of that phase renders a human being more susceptible to an attack of typhoid During the war in the first half of 1915, 14 836 Belgian civilians were inoculated in Ypres and its neighbourhood in the presence of a risk of infection very much more imminent than exists in Croydon at present Incidentally I may observe that in April 1915 the Belgian Government made inoculation compulsory under a penalty of expulsion from Belgium in case of refusal, the first instance of compulsory antityphoid inoculation of a civilian population The inoculations were carried out by the members of a well known Red Cross unit, and I was privileged to take a small part in the antityphoid campaign Besides the Belgian civilians all the members of the unit who served in Belgium and France several hundreds in number, were inoculated So far as I know no instance of increased susceptibility occurred among those thousands of persons

Then there is the question of the serum treatment Dr Watson Smith writes that in his hands in the Bournemouth epidemic serum gave equivocal results I am not surprised at that statement In years gone by I had some experience of serum treatment and found it very uncertain in its action I have had no experience of the serum at present in use, which, I gather from report, is that prepared at the Lister Institute under the direction of Dr Felix But two or three years ago Dr Felix was so kind as to lend me the notes and temperature charts of a number of cases treated with his serum in Egypt and Palestine and I also had the opportunity of hearing Dr McSweeney read a paper on the treatment From the facts then presented to me I came to the conclusion that the serum was certainly beneficial in some of the cases but that its action was very uncertain (In my view Dr McSweeney has not brought forward any further positive evidence in favour of the serum in his paper published in the last number of the *Journal*) I did not think that the results obtained were better than those observed in some cases treated in 1909 with a serum also prepared at the Lister Institute and reported by Professor Tanner Hewlett and others, including myself in the *Proceedings of the Royal Society of Medicine* for that year At that time I was of the opinion that the beneficial results were due to a specific action, but subsequent experience with serum and with vaccines at the Eastern Hospital Homerton and at the Queen Alexandra Hospital, Dunkirk, led me to alter my view and I now hold that some at any rate, of the beneficial results, and possibly the most dramatic of them are due not to a specific but to something in the nature of a protein reaction If the serum is not specific it will be of no use for temporary immunization But the circumstances of the Croydon epidemic do not appear to warrant the employment of a general immunization—I am, etc,

Hemingford Abbots Hunts Dec 5 E W GOODALL

SIR—In view of the diversity of the opinions expressed in your columns (*Journal* November 27, p 1092) on the value of prophylactic inoculation during an epidemic of typhoid fever, it seems imperative that the profession should arrive at a definite decision on this point. Will therefore, the opponents of this life saving measure be good enough to quote any statistics from actual experience in support of their views? After the simple precaution of boiling all milk and drinking water in a suspected area—which should at once limit the field of investigation and in many cases the spread of infection—has been put into practice, inoculation, which has stood the test of war conditions seems only a natural further precaution In doubtful cases it might be wise to employ smaller initial doses—I am, etc.,

J G FAYRER HOSKEN

Dursley, Gloucestershire Nov 30

SIR—In an article published by you on December 4 (p 1128) the following statement appears

> Perhaps the most extensive and careful study bearing on this point is that of Ramsey, who gave vaccine to 2 402 household contacts of whom only nine subsequently developed typhoid fever while among 2 886 unvaccinated contacts no fewer than 203 did so

I am afraid that a casual reader might suppose that the author, who is indeed a careful and accurate worker, put forward the figures you have quoted as being fairly comparable Not only did he explicitly state that they were *not* properly comparable but he provided statistically comparable data Ramsey was familiar with the gross fallacy of comparing totals which neglected the period of exposure to risk in the vaccinated and unvaccinated states It should be obvious that if one starts with a group of persons all exposed to a particular risk of disease and *over a period of time* gives doses of coloured water to some of the persons who had not, at the time the dose was given, suffered from the disease, the final percentage of drinkers of coloured water attacked by the disease must be smaller than that of all persons attacked, because a greater or larger proportion of the water drinkers passed through a period of risk before drinking the potion and, had they fallen ill would have been debited to the unprotected class

Analysing his data by a correct method Ramsey reached this result Among those who had received three inoculations the expected number of attacks was 25 and the observed number 6 Of those exposed between the second and third doses the expected number was 13 5 the observed number 8 Of those exposed between first and second doses the expected number was 18 5, the observed number 9 He concludes for good statistical reasons that contacts who had received a full series of doses enjoyed a substantial advantage over the controls but that in the other categories the advantage was doubtful—I am, etc

London W C 1, Dec 7 MAJOR GREENWOOD

Management of Typhoid Fever

SIR—With reference to my letter of November 29 (*Journal* December 4, p 1140) Dr R S Thomas of Exmouth has kindly sent me a copy of the dietary I gave him some thirty years ago as being the one I was using in typhoid fever and this has refreshed my memory as to details Three pints of whey fortified with plasmon and lactose as stated, were substituted for the milk diet then commonly used, and lemon juice orange juice and raw meat juice given The plasmon was made into solution by boiling in 12 fl oz. water, and 2 fl oz of the solution was added to alternate two hourly feeds of 5 fl oz whey the lactose being given with the other feeds

As already said other preparations are now available, and it would be useful if a dietist would suggest a dietary, as attractive as possible, which would produce a minimal residue while providing sufficient nourishment It would sometimes be helpful in other abdominal conditions—I am etc.,

W T GORDON PUGH M.D., F.R.C.S

Bournemouth Dec 6

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

465 Auscultatory Diagnosis of Joint Affections

O EISENSCHIMMEL EISEN (*Wien klin Wschr* September 3 1937, p 1251) believes that auscultatory diagnosis of joint affections has not become popular owing to the lack of systemization of recorded findings and the amount of practice required in auscultating healthy and diseased joints He suggests that the stethoscope be firmly pressed against the joint during active and passive movement A joint is best auscultated over the region of the capsule—namely, over the transverse processes of the spine the acromion process the femoral condyles, and so on In arthritis deformans an interrupted and muffled crackling or rattling sound is heard the same is true in chronic polyarthritis and Bechterew's disease In rheumatism there is a continuous rubbing or creaking which may be muffled or moderately clear In polyarthritis due to rheumatic fever arthritis following gout or infections—for example typhoid tuberculosis and gonorrhoea—there are no auscultatory signs The author states that auscultation often reveals the diagnosis long before bony changes can be seen radiologically

466 Erysipelas Statistics

R BRANDBERG and G AKESON (*Acta chir scand* 1937 79 6 495) review their experiences of 302 cases of erysipelas observed in a Swedish hospital between March, 1910 and June 1936, and fairly uniformly distributed over this period Of the 298 cases in which the sex was recorded only 123 were male and in this respect the authors experience coincides with that of other writers Discussing this sex difference the authors conclude that it reflects the comparatively great tendency of women to develop defects and changes in the skin which serve as points of entry for the infection But they do not confirm the opinion that injuries to the hands and forearms sustained in the domestic work of women are in part responsible for their comparatively great liability to erysipelas for in their own material there were only fifteen cases of erysipelas in women with this localization of the disease The age distribution was fairly even and though only one sixth (fifty two cases) of all the patients were over the age of 60 fourteen (two fifths) of the thirty-five deaths occurred above this age The mortality was twice as high when the neck trunk or limbs were invaded as it was when the head was the seat of the infection (twenty two deaths in 138 patients and twelve deaths in 162 patients respectively) There were seven deaths among the sixty four patients given intravenous and intramuscular injections of a Swedish polyvalent anti streptococcal serum Neither statistically nor clinically has the authors experience with serum treatment much impressed them and they attach most importance to general measures and to the stimulation of the circulatory system

467 Sex Frequency of Peptic Ulcer

J L HANSEN (*Ugeskr Laeg* October 28 1937 p 1145) has collected from the annual reports of certain Danish hospitals the records of about 14 000 cases of gastric and duodenal ulcer medically treated since the beginning of this century In the first decade the women greatly outnumbered the men Their numbers were approximately equal in the second decade In the third and the first half of the fourth decade the men outnumbered the women At the present time about three quarters of all the patients are males During these thirty five years the number of women patients has not changed much and if account be taken of the growth of the population the frequency of gastric and duodenal ulcer in women would seem to be falling rather than rising The rise in the case of men has been most marked during the past ten years and still continues In the period under review the facilities for hospital treatment have been much increased and the diagnosis of gastric and duodenal ulcer has become more accurate but neither of these two facts can explain the remarkable change in the relative sex frequency of these diseases The author does not profess to understand this change As for the observation that at necropsies most of the healed ulcers are now found in women and most of the open ulcers in men he suggests that this is so because some years earlier women were more subject to gastric and duodenal ulcers than men Now that men are in the majority clinically the number of cases of open ulcers found post mortem is bound to be relatively great among them

468 Pulmonary Tuberculosis of Bovine Type

B LANGE (*Dtsch med Wschr* September 24 and October 1, 1937, pp 1465 and 1506) reports from the Robert Koch Institute in Berlin the results of his type determinations of tubercle bacilli found between 1927 and 1937 in the sputa of 148 persons suffering from pulmonary tuberculosis He identified the human type in 136 cases the bovine type in nine and both types in three These three cases probably represented super-infections the bovine infection being secondary In as many as nine cases (eight pure bovine infections and one mixed) the patients had milked cows, and Professor Lange is emphatic in his recommendation that adolescents between the ages of 15 and 20 should not be employed as milkers unless the herds to which they are attached are under constant veterinary supervision This rule should be applied with particular strictness to such adolescents if they are found to be tuberculin negative—a condition reflecting a lack of acquired resistance to tuberculosis With some thousand persons dying according to Professor Lange from bovine infections in Germany every year it is incumbent on the authorities to stamp out tuberculosis in cattle even if it takes some twenty years to do so Meanwhile all milk which cannot be guaranteed as coming from tubercle free herds should be pasteurized or brought quickly to the boil Infants do not suffer from the consumption of milk thus treated, and whatever deficiency of vitamin C may be caused in this way can easily be replaced from other sources

Surgery

469 Juvenile Kyphosis

J SCHILDBACH (*Zbl Chir* September 4, 1937, p 2086) reviews 167 cases of juvenile kyphosis All classes of the population seem to be equally affected 57 per cent of the cases were girls Only eighteen patients were over 20 while between the ages of 14 and 17 both sexes were equally represented Of the 167 cases 122 were city dwellers while the country dwellers were represented only by forty five cases Twenty seven per cent of all cases showed a simultaneous scoliosis The author describes the early and late clinical and radiological manifestations and the methods of treatment Satisfactory therapeutic results were achieved in 136 out of the 167 cases twenty cases remained uninfluenced by the treatment while eleven showed an aggravation of the condition

470 Nephroptosis

H MATHIESEN (*Hospitalstidende* October 5 1937 p 1097) reviews the changes in fashions in the treatment of nephroptosis and points out that the enthusiasm for operative treatment waned when the ultimate results proved disappointing and attention was drawn to the fact that nephroptosis may be only one link in the chain

Research and Teaching in Rheumatism

Sir,—In Sir Leonard Hill's letter to you of November 29 he quoted the Chief Medical Officer of the Ministry of Health as having defined, in 1925, the arthritic unit (presumably the ideal one) as "an institution situated near and working in the closest co-operation with a large teaching school of medicine or a university which would enable it to fulfil the purposes of research and observation, as well as of treatment." If to observation, research, and treatment is added the word "instruction," there is, in London, one department, and, so far as I am aware, only one, which satisfies all these requirements. At the London Hospital there has been in existence for several years such a unit. This unit "works in the closest co-operation with a large teaching school of medicine *and* a university", there are obviously "opportunities for research", the unit has beds attached to it, specially earmarked for the observation and treatment of the rheumatic diseases, with clinical clerks regularly allotted to these beds. This unit is under uniform control with the Department of Physical Medicine, which has just been provided with a completely new building and modern equipment.

Finally, instruction in these diseases is imparted not only to medical students, before and after qualification. In September, 1936, a School of Physical Medicine was added for the instruction of women in the technique of this specialty.

Referring to the final statement in Mr Dudley Hobbs's letter in the same issue, it is obvious that Mr Hobbs was unaware of these facts. With regard to the penultimate phrase in that letter, the London Hospital rheumatism unit long antedates the formation of the Empire Rheumatism Council.—I am, etc.,

London, W 1, Dec 7 ROBERT STANTON WOODS

"Cures" in Rheumatic Disease

Sir,—Mr A G Timbrell Fisher (*Journal* November 27, p 1094) takes exception to the use of the word "cure" in spa advertisements, and suggests that members of the public have not the subtlety necessary to interpret the term as synonymous with a "course of treatment." The term "cure" in relation to spa treatment has been used for generations. We speak of "water cures," "milk cures," and "after-cures," and the Germans use *Kurhaus, Kurtaxe,* and *Kursaal*. We hear constantly that some distinguished personage has gone to this or that spa for a "cure" or to take a "cure," and the general public understand quite well what is implied. The large Oxford dictionary defines a cure as 'a particular method or course of treatment directed towards the recovery of a patient, as a water cure,' a 'milk cure,' etc," and refers to a publication by F Fuller entitled *The Cold Bath Cure* in 1704. The phrase "the cure is taking effect" is in daily use, and does not necessarily apply to balneological or hydrological methods of treatment. As an orthopaedic surgeon Mr Fisher comes in contact with the end results in cases of rheumatic disease, while the work of the spas is concerned *with the early and less chronic cases*. At the Royal Bath Hospital, Harrogate, the medical staff in their annual report do not publish any table of statistics of results. Results are a matter of degree, and depend on what the physician sets out to accomplish in each individual case. Further the benefits in many cases are not apparent until some time after the patient has gone home. As a spa physician of over thirty years standing I am convinced that a "cure" at a spa can be of very great benefit in the majority of rheumatic cases, and that it is superior to and more lasting than the more modern treatments by vaccines, protein shock, and gold therapy. The chronic rheumatic diseases consist of a series of signs and symptoms, depending on a number of factors which may be metabolic, infective traumatic, or even psychical. Each case must be treated individually. Even marked cases of osteo arthritis experience benefit, not that the osteo arthritis is removed, but because the accompanying fibrositis is relieved, and this lessens the pain though not *the disability*. Some cases receive benefit in a fortnight, others require four or five weeks' treatment.

The "cure," or "course of treatment" as Mr Fisher would prefer to call it, entails the employment of many factors—the internal administration of mineral waters to improve general metabolism, physical treatment such as hydrology, electricity, and massage, and last but not least, psychical treatment by change of environment, absence from the daily routine of household or business worries, etc., emphasis being laid on that form of treatment which, in the opinion of the physician, is most suitable for the case under consideration. I am quite at one with Mr Fisher in his objection to the extravagant advertisements regarding some of our spas and clinics, but I can see no objection to the comprehensive and concise term of "cure" which these establisments employ.—I am, etc.,

Harrogate, Nov 30 G L KERR PRINGLE

Correct Footwear

Sir,—The recent correspondence in your columns tempts me to suggest a new field of research. I refer to the feet and footwear. The numbers of men and women who try one style of shoe after another is evidence of the amount of foot discomfort which exists. But does *that discomfort end with the feet? May not many ills* be traceable to this source? What, for instance, may be the *effect of the modern chemically treated leather and* leather substitutes? Has rubber any deleterious effect? These may be matters of great importance. From observation over the last three or four years I know that the whole construction of shoes requires alteration. Not that one means to alter the appearance of shoes and make them ugly, but the method of building the shoes right from the foundation of the insole on the last urgently requires revision, because manufacturers attempt to comply with the shape of the foot *without any regard to its* physiology.

Properly corrected shoes will help in the treatment of many disorders of the stomach bowel, uterus, chest, etc., and also, as would be expected, in spinal troubles. Imbalance leads to contracted spinal muscles, and perhaps eventually to fibrositis and arthritis, and there may be a direct connexion between footwear and rheumatism and arthritis.

I recently treated a boxer who was thought to have broken his neck and had been put up in a plaster collar. When I saw him the collar had been removed but there was great tenderness of the tissues of his neck and any attempt at movement caused severe pain. For several days I tried, with little success to get his neck muscles relaxed; then I thought of his feet. The toes of both feet were contracted and claw like but fortunately with treatment and by adjusting his shoes they started to straighten out and function. The interesting thing is that immediately he started wearing the corrected shoes his neck muscles began to relax and voluntary movement increased day by day and I have no doubt that these contracted tissues were prevented from going on to a chronic fibrositic state.

I have seen so many cases of arthritis of the feet, knee, hip, spine, etc., helped by corrected shoes that I venture

of a general visceroptosis The author's material consists of seven men, forty-one women, and two children treated in a Danish hospital The nephroptosis was bilateral in nineteen cases, unilateral in thirty-one It was right-sided in all but four of these unilateral cases Some form or other of dysuria existed in forty cases, and in fourteen haematuria was demonstrable Cystitis was found in eighteen cases, and twenty had been associated with bouts of fever In only nine cases was the involved kidney palpable Partly by pyelography, partly by operation, hydronephrosis was demonstrated in sixteen cases, kinks of the ureters in fifteen, and rotation of the kidney in seven Calculi were found only in two cases In twenty-five cases nephropexies and in two cases nephrectomies were performed The nephropexies brought about recovery in twenty cases and improvement in two The author suggests that when an operation is not indicated the patient can often dispense with even conservative treatment But in certain cases relief of symptoms can be obtained with a well-fitting belt applied while the patient lies on her back with the pelvis raised The effect of a belt should be controlled by pyelography in the standing position The indications for operative treatment are severe attacks of colic, constant pain reducing working capacity, hydronephrosis, aberrant vessels or bands, nephrolithiasis, and relapsing pyelitis

471 Carcinoma of the Penis

W W WIGHTMAN (*Urol cutan Rev* September, 1937, p 621), who records three illustrative cases in uncircumcized men, aged 20, 69, and 79 respectively, states that carcinoma of the penis is not rare, but is second in frequency of all skin cancers Its incidence varies with geographical and racial differences In Europe it is seen in from 1 to 3 per cent of cases of carcinoma in the male, as compared with 17 5 per cent in Indo China and 10 per cent in Cochin-China Only occasionally is it found in Jews On the other hand, of seventy-eight consecutive cases of cornifying epithelial cancers among male Mohammedans seven were cancer of the penis Prolonged irritation and trauma are predisposing causes Most cases occur between the ages of 40 and 60 Penile cancers may be papillary, non-papillary, or ulcerating and infiltrating The course is relatively slow, being usually from one to three years Visceral metastases in the liver, lungs, heart, stomach, and nervous system, in that order, may occur but are rare Prophylaxis consists in circumcision to prevent irritation of the glans Treatment by irradiation is suitable in mild cases, but in advanced cases amputation is required

472 Ossification of the Tendo Achillis

H HUFNAGL (*Munch med Wschr* September 3, 1937, p 1410) describes three cases from the literature, and adds a fourth, of ossification within the tendo Achillis—this being the commonest site of such an intratendinous process, which is much rarer than the formation of bony spurs at the insertions of tendons or ossification within muscles towards their tendinous ends Accident appears to have preceded each case of ossification of Achilles's tendon and in addition one patient had had the tendon divided by a scythe, and another a tenotomy for talipes Hufnagl's case afforded evidence of cartilaginous and osseous metaplasia from connective tissue, it was treated, after excision of a length of 9 cm of tendon, by transplantation from the fascia lata No recurrence has appeared as yet, but the operation was only performed seven months ago

473 Angioma of the Knee

According to E RAGNOTTI (*Arch ital Chir* 1937, **46**, 2, 189) angiomata affect the lower limbs in less than one case in ten and are distinctly rare in the articular capsule of the knee-joint From a consideration of twenty-five recorded cases and one personal case he concludes that in this situation they occur in infancy or youth and generally call for treatment in the second or third decennium for repeated attacks of pain, sometimes following trauma and sometimes associated with intrasynovial effusions of blood or blood stained fluid With the exception of extreme flexion active and passive movements are in the intervals only slightly limited The knee shows a soft, elastic swelling, or swellings, over which the skin is movable, more commonly to one side of the patella Pre operative diagnosis is not always possible, but may be suggested by the occurrence of bloody effusions, by the occasional presence of cutaneous angiomata, by the tumour's increase of size in the erect posture and diminution when subjected to pressure and by the speedy radiological disappearance of opaque media injected into it Confusion with tuberculous arthritis is common Treatment is surgical, and usually leads to considerable haemorrhage There are circumscribed and diffuse forms, of which the latter may cause erosion of cartilage and bone, necessitating a resection of the articular surfaces

Therapeutics

474 Sulphanilamide in Cerebrospinal Fever

R TIFFENEAU and J J MEYER (*Paris méd* September 18, 1937, p 215) state that sulphanilamide is not only an effective drug in the prevention and treatment of streptococcal infections, but also in various other infections, such as those caused by the meningococcus, pneumococcus, gonococcus, *B coli* and *B typhosus* Intrathecal injection is unnecessary in cerebrospinal fever, and the dosage by the mouth should be some 6 grammes every twenty-four hours, an initial dose of 3 grammes being followed twelve hours later by 1 5 grammes, which is then given every six hours When the temperature has fallen, the meningeal signs have disappeared, and the cerebrospinal fluid has become normal the daily dose should be reduced to 3 or 4 grammes In the infant the daily dose should not exceed 2 grammes In most cases of cerebrospinal fever administration of sulphanilamide by mouth is sufficient to effect a cure in from one to three days In severe forms serum treatment is also indicated

475 Acacia Therapy in Nephrotic Oedema

M J LEPORE (*Ann int Med*, August, 1937, p 285) discusses the rationale of the treatment of nephrotic oedema by the intravenous injection of acacia solution The object of this form of therapy is to raise the serum colloid osmotic pressure, and thus to encourage the flow of fluid from the tissues to the capillaries Lepore treated four cases by this method, with favourable results as regards diuresis and diminution of oedema As a result of his study of these cases he concludes that the diuresis is due not so much to an increase of the plasma colloid osmotic pressure as to an increase in plasma volume For this reason he uses relatively small doses, usually 500 c cm of 6 per cent acacia in normal saline for adults, repeated at daily intervals for three or four days The plasma albumin level should be closely watched, and if it falls too sharply acacia therapy should be discontinued until the albumin level has been substantially improved A previous adequate trial of a high protein salt-poor diet and diuretics such as urea or saline diuretics is indicated Transfusions of whole blood, serum, or plasma should also be tried before using acacia The usefulness of the method is not limited to cases of nephrosis for the results have been equally good in cases of chronic active glomerulonephritis in the nephrotic stage The so called deleterious effects of acacia described by other writers may be explained on grounds other than those of the toxicity of acacia.

to suggest that proper shoes might be the means of preventing certain of these conditions, but medical research —quite apart from leather research—is necessary to enable us to find this proper footwear—I am, etc.,

London, W 1, Dec 2. THOMAS MARLIN

Radiological Imagery

SIR,—The recent correspondence on incorrect expressions in radiology (*Journal* November 20, p 1047) prompts me to call attention to the widespread misuse of the word visualize One constantly reads of radiologists "visualizing" the appendix, gall bladder etc meaning that they have made an image of the organ concerned on a film According to the Shorter Oxford English Dictionary, however, to visualize ' means to form a *mental* vision, image or picture of to construct a visual image *in the mind* (Italics mine) To use the word in the sense of making a thing visible to the eye is therefore quite incorrect More appropriate expressions would be "to demonstrate," ' to reveal,' or, more simply, to show —I am etc.,

Cambridge Nov 30 FF ROBERTS

Leriche's Work at Strasbourg

SIR—In view of the widespread interest that Professor Leriche s methods of dealing with pain have aroused in this country a short account of what is being done at his clinic is perhaps, timely He and his assistant surgeons are all well accustomed to visitors from abroad, and were always ready to demonstrate any method and to discuss its rationale

There was a great deal of gastro-intestinal surgery to be seen not essentially different from that over here, except for the frequency with which spinal anaesthesia or local infiltration with novocain was used I saw several cases of partial gastrectomy carried out entirely under local anaesthesia Endarteritis obliterans is quite a common condition in Alsace, apparently hence arteriography and arteriectomy were almost daily occurrences The most interesting cases were of course, those of infiltration with novocain for therapeutic purposes either of the area in which the pain was felt, or of the stellate or lumbar sympathetic ganglia I was told that with proper technique infiltration of the stellate ganglion was almost devoid of complications Though several were being done each day, in a year only two cases of pleural puncture had occurred, each leading to a pneumothorax which cleared up spontaneously in two days One case of syncope had resulted from injection of the solution into the vertebral artery but recovery was complete in less than an hour There were no complications after lumbar infiltration so I understood.

I saw a fracture of the surgical neck of the humerus treated by local infiltration The fracture was four days old and no active abduction was possible Thirty-six hours later after two infiltrations and no other treatment, active abduction through a right angle was possible without pain and without scapular movement A sprain of the internal lateral ligament of the knee joint was being treated successfully by repeated injections of novocain into the ligament. Pain in an amputation stump which had defied all treatment for five years had already been greatly improved by a combination of infiltration of the lumbar sympathetic plexus and of the sciatic neuroma cure was hoped for A septic arthritis of the knee in a young boy whose condition was poor in spite of good drainage of the joint, was treated by lumbar infiltrations every two or three days to improve the circulation in the limb A patient with constant tinnitus of ten years standing was completely relieved for three hours after infiltration with novocain of the stellate ganglion Another with neuralgia in the region of the mandible was receiving the same treatment Though I did not see it done I was told that capsular infiltration was often successful in giving relief lasting several months in osteo arthritis of the hip joint Cases of tennis elbow, sprained ankle and phlebitis were all treated by repeated infiltrations

Perhaps most striking of all was the use the local football clubs make of Professor Leriche s methods On the field it seems stands the players doctor, syringe in hand The moment a sprain occurs the appropriate spot is injected, whereupon the player goes on with the game, which he finishes without further pain I was told that later, when the effect of the novocain had worn off little or nothing was felt of the sprain owing to the inhibition from the beginning of the reflexes that set up oedema, muscular rigidity, wasting, etc Here would appear to be a practice particularly suited to sporting conditions, and it ought not to take more than a few weeks to test these findings in England—I am, etc,

London W 1 Dec 2 J H CYRIAX.

Antuitrin S Intradermal Pregnancy Test

SIR—I read with interest the article in the *Journal* of November 27 (p 1069) on the antuitrin S intradermal pregnancy test by Dr A Morton Gill and Mr J Howkins Their conclusion was—in a series of 147 cases, of which ninety-eight were females—that the test had proved to be valueless in their hands My own conclusion in a series of 400 cases (female), is to be published in the near future in the *Journal of Obstetrics and Gynaecology of the British Empire* and is that the test in its present form is not dependable In cases in which the antuitrin S test was negative indicating pregnancy, there was an error of 13 2 per cent, and in cases giving a positive reaction there was an error of 4.9 per cent

In addition in seventy-four cases the reaction was doubtful either in that the erythema was faint or the diameter of the erythematous zone approximated closely to 7 mm., which measurement is stated to delimit positive from negative results It is, of course, very unfortunate that the test is inaccurate, as the method is so simple and inexpensive However, it should not be totally rejected without further consideration, as it possesses interesting potentialities—I am, etc,

Glasgow Nov 30 ALBERT SHARMAN M D M C O G

SIR—I was interested to read the article by Dr A M Gill and Mr J Howkins on the antuitrin S test for pregnancy I have carried out a series of 234 tests this year using the same technique The following table shows the results

	Positive (Non pregnant)	Negative (Pregnant)
Females (non pregnant)	94	31
Females (pregnant)	42	67

I therefore came to the same conclusion—namely that the test was inaccurate for the determination of pregnancy The chief difficulty lies in the interpretation of the size and degree of the erythema of the skin, because this varies so much with the individual patient My thanks are due to Professor Fleming for permission to carry out the test on patients attending her clinics—I am, etc,

Obstetric and Gynaecological Unit, Royal Free Hospital W C 1 Dec 1 NORA L KEEVIL

Neurology

476 Granulomatous Encephalomyelitis due to an Encephalitozoon

A WOLF and D COWEN (*Bull neurol Inst N Y* August, 1937, p 306) describe a new human disease under the title granulomatous encephalomyelitis due to an encephalitozoon It occurred in a female infant, aged 29 days, who had had convulsions twenty-four hours after birth, and who for the six days before death had been acutely ill with fever, irritability vomiting, muscular twitchings, and generalized convulsions The cerebrospinal fluid was xanthochromic, contained 216 lymphocytes per c mm., and showed increased globulin and total protein, culture proved negative The ventricular fluid was similarly altered Macroscopically the brain showed yellowish areas of necrosis at the posterior ends of both Sylvian fissures, and the walls of the dilated ventricles were covered by a stringy yellowish exudate and denuded of epithelium The essential lesion was found microscopically to be an inflammatory granuloma, about 100 μ in diameter, composed of large oval or irregular epithelioid cells with numerous lymphocytes, and occasional plasma cells monocytes, and eosinophils There was an endothelial hyperplasia of the adjacent arterioles and capillaries and destruction of essential nervous elements at the site of the granuloma, but no definite microglial or astrocytic reaction These granulomata were widely disseminated throughout the nervous system, except in the cerebellum, and a diffuse spread of the lesion had caused the periventricular and the cortical necrosis An organism approximately 1 5 by 3 μ in size, and generally ovoid with a polar chromatin mass was found in the lesions The chromatin stained deep blue and the protoplasm pink with eosin and methylene-blue The organism occurred singly, or in dense oval or circular clusters surrounded by a fine membrane, and was both extracellular and intracellular. A localized chorioretinitis, which also contained the organism, was present in each eye The authors considered that the organism very closely resembled the encephalitozoon cuniculi found in rabbits and mice, and that it was probably related to this organism, if not identical with it The transmission of the disease is discussed, and it is suggested that this took place from the mother to the child during intra uterine life by way of the placenta The mother lived for the first five months of her pregnancy in a mice infested tenement Two incompletely described cases which appeared to be of the same type were found in the literature and the details of these cases are compared with the original case

477 Meningiomas of the Olfactory Groove

MARCEL DAVID and HARDEN ASKANASY (*Rev neurol* September, 1937 p 32) describe the results of a clinical, pathological, and therapeutic study of the meningiomas of the olfactory groove These cases formed 13 per cent of a total of 195 cerebral meningiomas operated on between 1928 and 1936 The age incidence varied from 34 to 63 years, but was greatest between 40 and 55 years Anatomically the tumours were classified into anterior, middle, and posterior types The middle type is usually bilateral and may be symmetrically so but is more often asymmetrical It develops slowly excavating both frontal lobes and pressing on the genu of the corpus callosum It is indented by the falx cerebri and although the insertion of the falx and the crista galli is often invaded the superior longitudinal sinus is never affected It may extend into the nasal fossa and it may compress the optic nerves but it does not become adherent to them The anterior cerebral arteries and their callosal branches are closely related to the tumour The anterior type is generally unilateral and arises in the space between the falx the frontal bone and the olfactory groove It does not compress the optic nerves The posterior type may develop bilaterally when it compresses both optic nerves and even the optic chiasma, and may involve the third ventricle and adhere closely to the great vessels of the base of the brain, or it may be unilateral and compress only one optic nerve The cardinal signs and symptoms are (1) constant headaches, early in onset and generally frontal and orbital, (2) anosmia which is often the first symptom, is very constant and may be unilateral or bilateral (3) diminution of visual acuity with or without a central scotoma, complete or only for colours, is an important sign (primary optic atrophy was only present with the posterior tumours, and hemianopic field defects were rare) (4) mental symptoms are generally late, but they may be early and marked, mental apathy, failure of memory, or change in character being the most usual though Korsakoff's syndrome and manic-depressive and hallucinatory states have been observed Accessory signs were facial paresis without lateralizing value, facial neuralgia, frontal ataxia and symptoms due to disturbance of the pituitary and the hypothalamus *X*-ray examination is likely to give information of value in more than half the cases and the ventriculogram, showing amputation of the frontal lobes is characteristic The differential diagnosis and the operative procedure are dealt with fully, the operative mortality is 30 per cent

478 Vestibular Symptoms after Concussion

G PORTMANN and J DESPONS (*Rev Laryng* June, 1937, p 585) describe their observations in thirty six cases of head trauma After head injuries patients often complain of vertigo much less often of deafness and tinnitus Ten of the patients had spontaneous nystagmus, if this appears soon after the concussion it probably indicates a lesion of the labyrinth but if the spontaneous nystagmus persists for several months after the accident it is more likely to be due to a more central lesion Of the thirty six patients twenty had hyperexcitability of the vestibule when tested by the rotation or caloric method nine showed normal reactions, seven showed responses which were less than normal (hypoexcitable) Among the cases of hypo excitability there was a great preponderance of cochlear lesions (deafness tinnitus, etc) According to the authors this proves that hypoexcitability occurs when the labyrinth has been directly injured by the concussion and there is some loss of function Hyperexcitability of the vestibule after concussion is much more difficult to interpret The causes may be psychic or due to alterations in the vasomotor mechanism or increased intracranial pressure without any peripheral lesion of the labyrinth If the multiple causes of hyperexcitability are borne in mind it is easy to understand why previous studies in this field have given very variable and often contradictory results

479 Syringobulbia and Syringomyelia

F KRAUSE (*Dtsch Z Nervenheilk.*, June 21 1937, p 14) considers the theories of the origin of syringobulbia and syringomyelia basing his discussion on the description of one case in which he believes that a typical syringobulbia has developed following an exogenous injury The case was that of a young man of 26 years who was apparently well until he developed an illness diagnosed as influenza Examination six weeks after the onset of symptoms showed that he had a lesion of the right side of the medulla He complained of giddiness and vomiting on sitting up and also of attacks of tachycardia Following x ray treatment he improved generally and also in respect of the neurological signs He was able to resume work for three years after which period symptoms of intense giddiness and headaches again recurred and the typical neurological signs of a syringobulbia and syringomyelia were found The patient died following an operation for duodenal ulcer At necropsy there was found in the medulla oblongata an irregular slit on the right side following the course of the twelfth cranial nerve There

Applying for Hospital Appointments

Sir—It has recently been my lot to submit applications for appointment to the honorary staff of three different hospitals, and I wish to call attention to certain unnecessary hardships which affect those who apply for these posts First, it is practically essential to submit a printed application for a post on the honorary staff, and often desirable to do so even for the post of registrar, the cost of doing this is by no means negligible, averaging between £2 and £2 10s for each appointment applied for Further, the time taken to get in fresh testimonials and have the application printed curtails the short interval usually allowed before the application has to be sent in Secondly, it is necessary to persuade one's present or late "chiefs," or other well-known medical men one may happen to know, to give fresh testimonials for each post applied for, a proceeding which becomes irksome to them and embarrassing to the man who has to ask these favours several times at short intervals, after a succession of failures to secure posts Lastly, the most important grievance that I wish to air is in respect of visiting members of the honorary staff, generally at their consulting rooms It is essential to do this as some of them are deeply offended by any failure on the part of the candidate where this formality is concerned Of course it is a pleasure to call on some of them, who could not be more courteous or considerate, but there are unfortunately not a few whose conduct is distinguished by a lack of consideration and even of common politeness I have several times had appointments made and have found on arrival, at a time arranged to suit the consultant though at considerable personal inconvenience, that he has not troubled to keep the appointment Sometimes they or their secretaries rudely say that they will not see you, as if you were insulting them by asking, which unfortunately one has to do as things are at present Again, others think nothing of keeping one waiting sometimes as much as an hour or more, and when they eventually do deign to see one they glibly say that they are not interested in the appointment and will not be attending the meeting These formalities have to be complied with by those seeking appointment to the honorary staff, but they also apply, though usually to a lesser degree, to those seeking the post of registrar, and, in some hospitals, even to house appointments

By way of constructive criticism I would like to suggest

1 That the general rule should be that applications are to be typed or duplicated, which is quicker, cheaper and just as legible as printing

2 That the hospital secretary should definitely ascertain which members of the staff wish to be called on and should inform the candidates that they must call on these consultants and on them only

3 That some sort of preliminary selection from among the candidates should be made by the committee and the obviously unsuitable candidates ruled out before the stage of visiting begins It is obviously absurd for twenty or more candidates for one post to call on all the members of the staff when a 'short list' of the likely men would surely suffice

4 The farce of submitting testimonials might well be done away with generally most of the committee do not read them and if they do most of the testimonials read much the same— 'I have formed a very high opinion of Mr Smith's abilities as a surgeon. He is an agreeable and hard working man with sound judgement and fair operative ability I have pleasure in recommending him as surgeon to your hospital, etc'

The whole thing is reminiscent of the giving of a "character" to a retiring maidservant, and it would seem that some more useful and enlightening method of selection could well be adopted In view of the fact that I am likely to continue "applying for jobs' for some time to come, I beg the indulgence of remaining anonymous for my own protection—I am, etc,

London, W 1, Dec 1 F R C S

Inhalational Therapy

Sir,—Having had experience of this therapy, based on a long period of clinical investigation, I feel it would be unfair to the organization responsible for its introduction into this country, unfair also to the thousands of doctors using this treatment in different parts of the world, and unfair, too, to the numerous hospitals and institutions where it is being also used, if Dr Harrington's letter (November 20, p 1047) were left unanswered The letter, too, may be productive of a more serious injury in that it may prevent those contemplating the use of this treatment from carrying out their intention The ingredients used in the medicament have been published There is no secret about the machines, thousands are in use in different parts of the world, and I am assured there is no patent on them The treatment is only given to patients on the recommendation of their own medical attendants, and always under medical supervision The organization has never advertised How is it possible to curb newspapers when they hear of sensational benefits derived? Surely Dr Harrington does not intend to convey to those medical men using the treatment with advantage to their patients that, because of this publicity, they should dissociate themselves from the treatment.—I am, etc

Weybridge, Nov 22 A. C Greene.

*** We understand that the formula for the mixture of drugs used in the Duke-Fingard treatment still remains undisclosed—Ed, *B.M.J*

R M B F Christmas Gifts

Sir—My anxiety increases as the time for the distribution of our Christmas gifts draws near I am indebted to many of your readers who have responded to the appeal which was made in October, but I fear that the amount subscribed to date falls far short of the sum which is needed if we are to give the much-valued Christmas gift of 30s to all our regular beneficiaries

Christmas Day to all of us is a very special day, it brings back memories of happy days in the past, and all have the wish to make each Christmas Day a happy day in our own home life I have intense sympathy for so many of our beneficiaries living in loneliness, some in one bed-sitting room at a rental of 10s a week without relatives and without friends and who can look only to the Fund as the society which "never forgets them" on Christmas Day

I ask everyone who reads this last appeal not to pass it by but to send a donation, however small or large, without delay to the Hon Treasurer, Royal Medical Benevolent Fund, 11, Chandos Street, Cavendish Square, London, W 1, so that we may be in a position to give the 30s Christmas gift to those who have so little of their own and who are befriended by the Fund—I am, etc,

Thos Barlow
President.

Dec 1

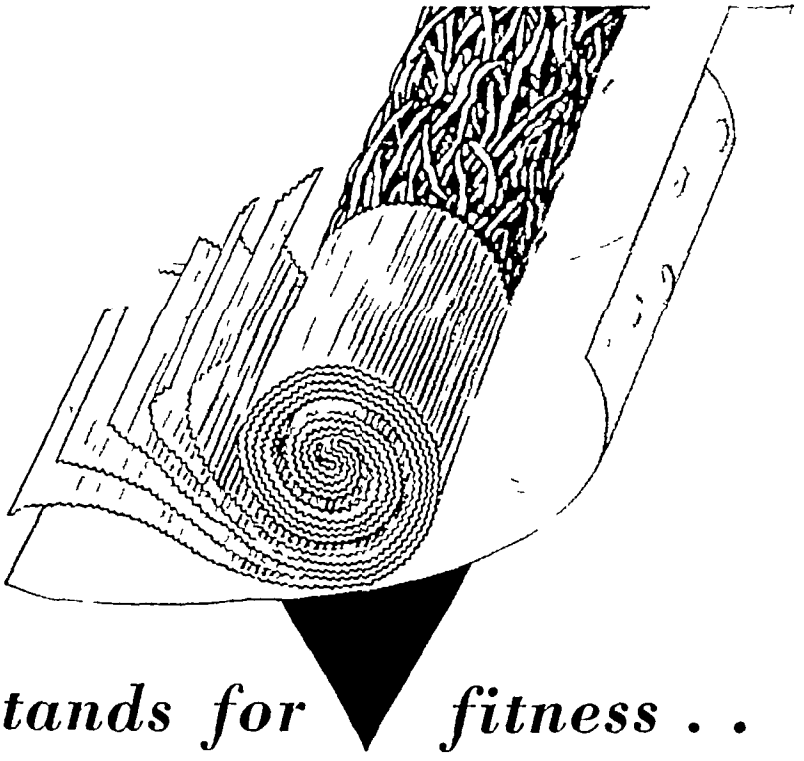
was also cavity formation in the upper part of the spinal cord The histological changes were typical, so that syringobulbia and syringomyelia had developed in a a healthy young man following an inflammatory or vascular lesion of the right side of the medulla oblongata This lesion resulted in reactive changes not only at its site but also in the surrounding tissue, giving rise to glial scarring and later cavitation The cavitation in the spinal cord is more difficult to explain, but may have been secondary to obstruction of lymph flow or to alteration in the circulation of the cerebrospinal fluid The author further considers that in syringobulbia generally the site of the fissuring is connected with the course of the blood vessels supplying the medulla This case is held to support the viewpoint that syringobulbia and syringomyelia follow exogenous injuries in normal subjects, such as chronic myelitis, local meningitis, trauma, spinal concussion, haematomyelia, and vascular lesions The more widely held theory that syringomyelia is primarily a developmental disease and that the gliosis and cavitation are secondary to a defective closure of the medullary tube is criticized by the author on the grounds that syringomyelia is not a familial disease The so-called familial cases in the literature are analysed and not accepted

480 Cobra Venom in Tabetic Crises

A ROTTMANN (*Klin Wschr* July 24, 1937, p 1051) remarks that gastric crises and severe lancinating pains most often affect those tabetics who have otherwise few symptoms, and that serological tests of their cerebrospinal fluid are commonly negative During the past two years he has treated with cobra venom many such patients who had had intractable sensory root symptoms (pain or gastric crises) for years, despite efficient antisyphilitic medication Its use was suggested by the relief of pain which has been reported by French and other observers in cases of cancer, a similar analgesic action in the luetic granulation tissue of the extramedullary part of the posterior roots might, it was surmised, give relief in severe sensory tabetic symptoms Rottmann of late has used the cobra neurotoxin in a specially concentrated form The results have been very satisfactory After initial and marked improvement many patients, as was expected, had recurrences which necessitated repetition of the treatment at regular intervals or as called for clinically Dosage is variable, but as a rule begins with 8 to 16 mouse units at intervals of three days, and is later increased With therapeutic improvement there are signs of intoxication, which suggest affection of the higher vegetative nerve centres—hunger, thirst, drowsmess, delirium, sensations of undue heat or cold, nose bleeding, profuse sweating, etc Toxic symptoms may call for treatment by calcium or pyramidon Local reactions are common after the first injections, it is inadvisable to give iodine, or to paint the skin with it On theoretical grounds, and from its total failure in his hands to relieve pain in various forms of neuritis, Rottmann concludes that the poison has no direct analgesic action, but acts on syphilitic granulations near the root fibres

481 Superior Longitudinal Sinus Thrombosis

ORVILLE T BAILEY and GEORGE M HASS (*Brain* 1937, 60, 3, 293) describe three cases of sinus thrombosis in early life which was not immediately fatal, and discuss the possibility that certain acquired cerebral defects may be due to the thrombosis of the superior longitudinal sinus and its sequelae The first case was that of a boy, aged 6, who, after acute bronchitis and otitis media, developed symptoms of increased intracranial pressure and became dull and apathetic, there were no localizing neurological signs There were bilateral papilloedema, neck rigidity, and dilatation of the scalp veins on the right side The cerebrospinal fluid contained some blood and was under pressure, while fluid from the subarachnoid space was xanthochromic The patient showed progressive impairment of intelligence and died five months later from cardiac failure due to mitral stenosis At necropsy thrombosis of the right lateral sinus and the posterior two-thirds of the superior longitudinal sinus, which had probably resulted in obstruction of tributary cerebral veins producing haemorrhage and necrosis of the brain, was found The second case was that of a female child, aged 10 months at the time of death, who when one month old developed an acute illness, with diarrhoea and vomiting, which was followed by retardation of mental development Later, when six months old, she had several convulsions, which were succeeded by symptoms of increased intracranial pressure Investigation revealed the presence of bilateral intracranial haematoma, and there was blood in the ventricular and the lumbar cerebrospinal fluid Death followed operation, and at necropsy an organized thrombus in the middle third of the superior longitudinal sinus was seen This had probably developed at the first illness and had later led to haemorrhage into the meninges and the subdural space The third case was that of a male infant, aged three and a half months, who at one month developed thrombosis of the anterior half of the superior longitudinal sinus in association with an acute nutritional disturbance characterized chiefly by diarrhoea This resulted in bilateral cortical and subcortical necrosis, with attendant haemorrhage into the pia-arachnoid Organized and canalized thrombi were discovered in the cerebral veins The authors regard these cases as demonstrating the fact that thrombosis of the superior longitudinal sinus is not necessarily fatal in a few days, and that it may give rise to acquired cerebral defects This may be the true explanation of some cases in which acquired neurological abnormalities are ascribed to an early attack of encephalitis



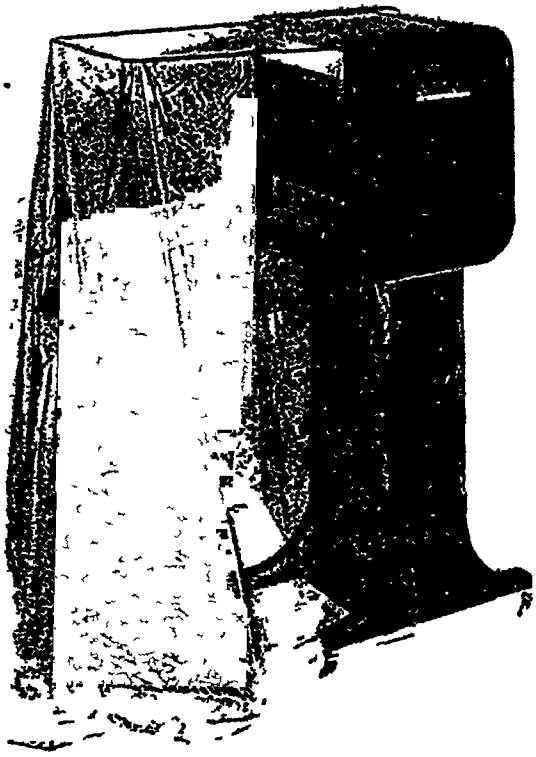
482 Parietal Lobe Tumours

O FRAGNITO (*Riv Neurol*, August, 1937, p 345) mentions as the localizing signs of tumours of the parietal lobe (1) the cortical sensory syndrome, with disturbances of the sense of spatial relationships, and astereognosis, (2) frequently unilateral ataxia, and homonymous hemianopia, (3) sometimes, in cases of left-sided tumour, word blindness He describes a case of left subcortical parietal tumour in which the earliest symptoms of right Jacksonian convulsions and right limb ataxia were followed by right hemiparesis and hemi-anaesthesia, together with a further sign which has been claimed to be typical of parietal tumour—namely, muscular atrophy most pronounced in the hand Silverstein in 1931 reported this sign in eight cases, Fragnito has usually found it absent, but in the cases in question either the tumour spared considerable portions of the parietal lobe or the clinical course was very acute

483 Tuberculosis and Mental Disease

C H. ALSTRÖM (*Hygiea* September 15, 1937, p 647) has investigated in Stockholm the frequency with which the subjects of mental disease requiring asylum treatment die of tuberculosis There were 1,296 deaths among asylum inmates in the period 1924 to 1936, classified according to their age and the character of their mental disease Of the 322 deaths among schizophrenics 110 were due to tuberculosis, and among the 166 schizophrenics dying under the age of 50, ninety-two A study of the duration of the schizophrenia at the time of death showed that tuberculosis was responsible for only 16 5 per cent of the deaths during the first two years of the mental disease, but after two years tuberculosis was the cause of about 65 per cent of all the deaths, and this ratio was maintained till the schizophrenia had lasted up to ten years Thereafter tuberculosis dwindled gradually in importance as a cause of death among schizophrenics till it played no more important part than it did in the other forms of mental disease which were associated with a comparatively low tuberculosis mortality Thus, among sixty-eight deaths

The du Maurier filter tip



stands for fitness . .

Smoking and fitness can be enjoyed together in du Maurier cigarettes. Every trace of irritant that might worry a sensitive throat is trapped in the five layers of the filter tip. No bits of tobacco can get past but all the full flavour of the Virginia tobacco comes through — cool and smooth and fragrant. That holds good whether you prefer the cork tipped du Maurier (red box) or du Maurier medium with the plain tip (blue box)

du MAURIER

the perfect cigarette with the exclusive filter tip

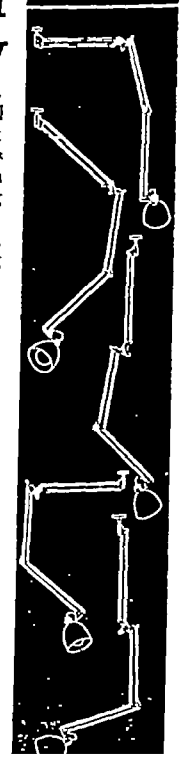
The **TERRY** CEILING MODEL

Anglepoise



As good as a second right hand in the surgery

Yet another tremendous advance in surgery examination lamps—the Ceiling Model Terry Anglepoise Out of the way, yet instantly to hand at a touch, pouring its strong, penetrating concentrated beam *right on to the spot*, without any distracting glare in the user's eyes Will practically reach to any part of the average surgery, thus avoiding awkward light shifting when the patient must not be moved Leaves both hands free A perfect examining and dressing lamp For sheer efficiency and convenience nothing can simply approach the ANGLEPOISE—adjustable to 1,001 positions at a finger touch—and poised at any angle Simply marvellous for all "close" work as it throws the clear light necessary for extreme accuracy It can be brought as close as required Saves on light bills—a 25 watt bulb works like a 60! Scientifically built—every part superlatively made Chromium plated arms, tireless springs—for perfect balance In several models Models for fixing to wall or table, and on smooth running castors "A Triumph for Terry Springs" From 50/- (U.K. only) Patented at Home and Abroad

HERBERT TERRY & SONS

NOTE THE ANGLES

of persons suffering from manic depressive psychoses only four were due to tuberculosis The corresponding figures for senile dementia were 463 and ten respectively For the pre senile psychoses they were eighty-two and twelve respectively, and for a mixed group of epileptics paralytics, etc they were 361 and twenty-seven respectively It is evident that the notorious influence of tuberculosis on asylum deaths must be traced almost exclusively to the association of this disease with schizophrenia The author supplements his own data by a reference to the work of Goransson whose study showed that 30 per cent of the deaths in 1927 in Swedish mental hospitals were due to tuberculosis whereas the corresponding figure for the country as a whole was only 11 3 per cent

484 Effects of Irradiation on Gliomas

I M TARLOV (*Arch Neurol Psychiat* Chicago Sep tember, 1937 p 537) reports the results of a study of the effects of x ray therapy on the microscopic appearance of gliomas The medulloblastomas presented striking histological changes after irradiation—a decrease in the number of cells in the tumour, degenerative changes in the cells, and an increase in connective tissue no strict correlation, however existed between the intensity of the histological change and the dosage of x rays, or the period of survival In the small series of glioblastomas no definite evidence of regressive changes was found In one case, which received the greatest dosage, extensive cystic degeneration with dense connective tissue scarring was found, but there was also concomitant invasion of the brain by tumour cells In one case of medullo-epithelioma a slight increase in connective tissue was the only change noted In two cases of astroblastoma irradiation caused cellular degeneration with the production of multinucleated and bizarre types of cells, areas of focal and massive necrosis, and adventitial thickening of the vessels In five cases of astrocytoma no definite changes were observed but in a sixth case which received a large dose of *x* rays, extensive degeneration of tumour cells and blood vessels occurred, with connective tissue scarring At the same time in this case there was widespread growth of the tumour throughout the brain, and polar spongioblasts predominated in many parts of the tumour There was also evidence of damage to the blood vessels and the nerve cells of the brain This case suggested that some tumours might become less differentiated after irradiation and grow more rapidly In two cases of ependymoma a slight increase in connective tissue with a tendency to cystic degeneration was found, but in two cases of oligodendroglioma there were no changes more marked than those that had been observed in a control case. The author considers that the focal necrosis and the changes noted in the tumours are direct effects of the irradiation of the cells and are not secondary to vascular changes The medulloblastoma is the only glioma which showed a uniformly beneficial effect after x-ray treatment In cases of glioblastoma and astroblastoma intense irradiation still seems justifiable but in the other types the possibility that a more rapidly growing tumour may be produced has to be borne in mind

Obstetrics and Gynaecology

485 Overweight in Primiparae

E MÖLLER CHRISTENSEN (*Ugeskr Laeg* September 16 1937, p 965) has undertaken a statistical study at a maternity hospital in Copenhagen in order to ascertain the influence of overweight in primiparae on the course of pregnancy labour, and the puerperium He defines as over weight any patient who on the termination of pregnancy weighs at least 20 per cent more than a normal non pregnant woman of equivalent height and age His material consisted of 242 primiparae who conformed to this definition and none of whom weighed less than 13 st 5 lb His control group consisted of 500 primiparae of normal weight none weighing over 11 st at the termination of pregnancy In both groups there were only vertex presentations, and none of the births were premature in neither group were there any twins During pregnancy 21 4 per cent of the overweight group suffered from nephritis, 6 2 per cent from hypertonia and 11 6 per cent from pyelitis The corresponding figures for the controls were only 1 6 0 4 and 4 8 per cent respectively While labour lasted thirty six hours or more in 21 per cent of the first group this was the case with only 7 per cent of the controls. Weakness of labour pains was observed in 18 4 per cent of the overweight patients, and only 4 4 per cent of the controls The corresponding percentages for premature rupture of the membranes were 14 8 and 4 respectively They were 8 7 and 0 6 respectively for fever during labour 12 4 and 3.2 respectively for threatened uterine asphyxia 16 9 and 5 respectively for the artificial termination of labour, and 16 1 and 2 7 respectively for large tears of the perineum Retention of the placenta severe post partum haemorrhage puerperal fever, phlebitis, and various other complications were much more common among the overweight patients than the controls, and the infant mortality was higher The author concludes that overweight women should be taught to reduce their weight to normal if there is a chance of their becoming pregnant

486 Oedema in Pregnancy

W C W NIXON (*Chin med J* September 1937 p 317) discusses the aetiology and treatment of oedema in pregnancy unassociated with signs and symptoms of toxaemia He considers that in many cases oedema may be due to malnutrition and a consequent reduction of plasma proteins There may also be a deficiency of vitamin B_1 causing an endocrine imbalance which affects particularly the posterior pituitary An excessive production of the vasopressor and antidiuretic hormones by the posterior pituitary is likely to induce oedema In the treatment of these cases he uses the following routine (1) for the first twenty-four hours he gives 20 oz of 30 per cent glucose by the mouth and on subsequent days the amount of fluid given is 2 oz. less than the urinary output of the previous twenty-four hours however if there is oliguria the daily fluid intake is 20 oz., (2) diuretics such as euphyllin, are given intravenously (3) 50 to 100 c cm of a 50 per cent solution of glucose are injected four-hourly intravenously (4) some preparation of vitamin B_1 should be given (5) cardiac stimulants—for example, coramine —are administered The weight of the patient gives the best evidence of a decrease or increase of oedema

487 Bronchial Asthma in Pregnancy

L LAMI (*Rif med* August 21 1937, p 1202) who records two illustrative cases states that the cases in which bronchial asthma and pregnancy coexist may be classified in the following three groups (1) those in which the asthma preceded pregnancy and became more pronounced after its onset (2) those in which asthma only developed during pregnancy and persisted until term but usually lasted only a few months (3) cases in which asthma occurred before pregnancy but became less or disappeared entirely during its course and recurred after delivery Lami's first case was that of a woman who in the course of thirteen years developed asthma only during pregnancy or menstruation and it was not until after her eighth pregnancy that the attacks occurred independently of pregnancy The second case resembled the first in that the attacks only occurred during pregnancy and menstruation but was peculiar in the following respects (*a*) during the attack there was considerable hyperpnoea whereas in typical asthma the respiratory rate is often reduced (*b*) there was dyspnoea out of all proportion to the signs of bronchial obstruction and (*c*) treatment with luminal was successful

Whenever liver is indicated give

Hepferol

BRAND

Active Liver Principles with Iron in Palatable Granule form

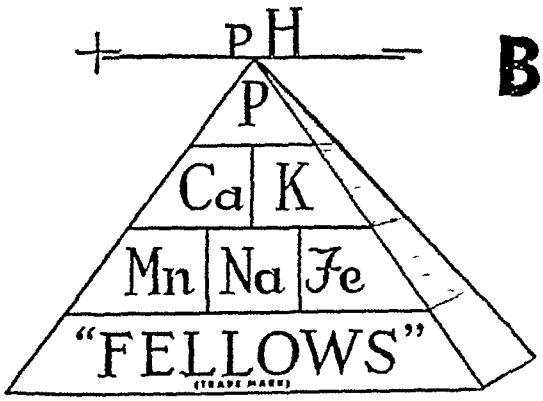
4 & 8 oz Boxes

In cases of pernicious anæmia and in all anæmic conditions which do not respond sufficiently to iron therapy alone HEPFEROL is especially indicated Prepared from a standardised dry extract of liver with added iron Readily assimilated by the organism Constancy guaranteed

When iron is indicated prescribe

IDOZAN

BRAND



5% of Fe Colloidal Iron Solution

8, 40 & 80 oz Bottles

IDOZAN meets the fundamental requirements of an effective iron therapy It establishes a strong positive iron balance, it is easily absorbed from the intestinal canal providing a ready and abundant storing of surplus iron IDOZAN is non-constipating non irritating and does not discolour the teeth

488 Vitamin C in Tuberculosis

E Haefliger (*Dtsch Tuber-bl*, August, 1937, p 185) recalls that numerous observers have recorded that vitamin C deficiency in the diet influences unfavourably experimental tuberculous infections in animals Testing vitamin C metabolism in fifty-five sanatorium patients, both early and moderately advanced cases, by estimation of its increased urinary excretion after the oral administration of ascorbic acid, he found that with the ordinary institutional diet, rich in fruit and vegetables, vitamin C deficiency was rare Only about 10 per cent of the patients showed an excretory deficit of 1,000 mg or over, and this deficiency seemed to be unrelated to the course of the illness, the sedimentation rate, or the general condition Treatment by vitamin C is probably desirable in those patients showing a deficiency, untoward effects, such as activation of quiescent lesions, have not been noted

489 Mechanism of Vaccination

P D McMaster and J G Kidd (*J exp Med*, July, 1937, p 73) report experiments showing that in rabbits an antiviral principle is elaborated in the lymph nodes draining skin into which vaccinia virus has been injected When vaccinia virus was injected intradermally into the ears of rabbits, whether the ears were subsequently amputated or not the virus could be demonstrated in the corresponding cervical lymph nodes in increasing amounts up to the third day, and then in gradually diminishing amounts till on the eleventh day it was no longer demonstrable These changes were not due either to differing amounts of virus reaching the lymph nodes involved or to the inflammatory condition of the nodes When the dose of virus was adjusted to give only a localized infection which resulted in the production of generalized immunity, it was found that even after three days the lymph nodes draining the site of injection contained an antiviral principle while the serum and tissues contained none As time went on the virus neutralizing power of the cervical lymph nodes of the virus injected side and of the serum and tissues increased, until after eleven to fifteen days there was generalized antiviral activity throughout the body of the injected rabbits From the third to the seventh day both virus and antiviral principle could be demonstrated in the cervical lymph nodes of the virus-injected side The cervical lymph nodes of the uninjected side did not show any antiviral principle even when caused to be inflamed It was not possible to demonstrate the presence of antiviral principle in the tissues of the virus-injected ear Since the antiviral principle was found in the lymph nodes draining the site of virus injection earlier than in other tissues, since no other site of its formation was demonstrable, and since it was not found in the corresponding nodes on the uninjected side, even when these were comparably inflamed, the conclusion reached is that the antiviral principle was elaborated in the lymph nodes draining the site of the injection of vaccinia virus As the experiments correspond in nature to clinical vaccination, the inference is that the immunity conferred by Jennerian vaccination is largely of lymph node origin

490 Toxic Effects of Follicular Hormone

J v Baló and B Purjesz (*Klin Wschr* August 14, 1937, p 1150), experimenting on dogs, have found that twenty daily injections of large doses of follicular hormone (50,000 units of oily ketohydroxyoestrin) induce (1) lethal erythrocytopenia diminution of thrombocytes, leucocytosis with displacement to the left of the Arneth count, and transformation of the bone marrow into a greenish tissue comparable with that shown in human myeloid leukaemia, and (2) a transformation of the cylindrical epithelium of the prostatic glands into squamous epithelium of several layers, sometimes showing keratinization Similar blood and marrow changes have been observed by other workers with male sex hormone in male dogs, but not with androsterone The prostatic changes resemble those similarly induced in rodents In this connexion v Baló and Burjesz recall that large doses of follicular hormone have been reported as inducing fibrocystic conditions or adenocarcinoma in the breast, and epithelial proliferations in the prostate and uterus of animals other than dogs

491 B C G Vaccination

K Birkhaug (*Nord med Tidskr*, August 14, 1937 p 1333), to whose laboratory in Bergen the preparation of B C G for the Norwegian medical profession has been entrusted, comes reluctantly to the conclusion that B C G cannot be accepted as a *virus fixe* But he also finds that nearly all bacteriologists now agree that B C G never provokes progressive and fatal tuberculosis, not even in such susceptible laboratory animals as guinea-pigs As for the differences in the behaviour of "smooth" and "rough" strains obtained by culture of B C G, he does not believe that these differences are so wide that they need cause alarm, and instead of anticipating that the most suspect strains will increase in virulence in the course of time he thinks that evolution will occur in the opposite direction, and that B C G will ultimately lose its present ability to confer immunity to virulent tubercle bacilli Of all the vaccines at present available for the prevention of tuberculosis B C G is the one which stands out most prominently as an agent for increasing resistance to tuberculosis to a considerable degree The oral method of administration is far less reliable than the intracutaneous method, which the author recommends to the total exclusion of the former He does not, however, counsel the abandonment of any of the social preventive measures which have proved so effective in reducing the tuberculosis mortality during the present century, and he looks upon B C G vaccination as a supplementary measure to be recommended for tuberculin negative persons exposed to infection from cases of open tuberculosis

492 Weltmann Reaction in Pulmonary Tuberculosis

A Havas and S Schawrowa (*Acta tuberc scand* 1937, **11**, 1, p 54) performed 656 tests on 279 patients with a view to ascertaining the value of Weltmann's non-specific serum-coagulation reaction in pulmonary tuberculosis, and came to the conclusion that it is a most useful auxiliary method both as regards diagnosis and prognosis, since (1) it helps to determine whether the pulmonary condition is "fibrotic" or "exudative" in type, (2) it gives clear indications of the way in which the disease is progressing some days before any definite changes can be made out either clinically or radiologically, and (3) it gives some indication of the efficacy or otherwise of an artificial pneumothorax or a thoracoplasty The authors describe their own micro"-technique, which is a modification of Weltmann's macroscopic method, is much more easily carried out, since it only needs twelve drops of blood and no elaborate apparatus, and gives just as accurate results The readings obtained may be "short" (0 9 to 0 6), 'medium" (0 5 to 0 4), or 'long" (0 35 to 0 3 or less) Briefly, a "long" reaction indicates a chronic or fibrotic type of disease and is relatively favourable, whereas a 'short" reaction points to an acute or "exudative' type (or an acute exacerbation in the course of chronic disease) and is unfavourable Although even a single test may be of some value, it is, of course, better to make serial tests, the intervals (monthly, weekly, or even daily) depending upon the severity of the disease In any case the readings should always be considered in conjunction with the history and clinical findings

QUEEN *non-irritant* Toilet Preparations specially for prescription in Allergic cases

Leaders of the profession have found these of great use as an alternative to beauty preparations and cosmetics suspected of giving rise to allergic symptoms Completely free of Orris in any of its forms or other Irritants. Through any Chemist or direct from —

DRY SHAVING PERFECTED

NO BRUSH
NO WATER
NO CUTS
NO SOAP
NO RAZOR
NO LOTIONS

HYGIENIC AND EXPEDITIOUS ALWAYS

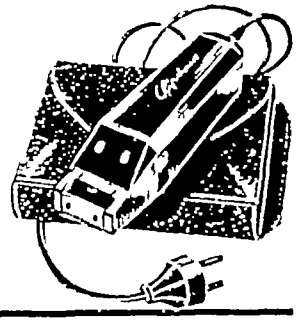
USEFUL IN AN EMERGENCY

THE introduction of the Clipshave Electric Dry Shaver brings the necessary preliminary of shaving more in keeping with modern ideas of surgical cleanliness. Always ready for use simply plug into nearest electricity point and the work is completed in a few minutes. No lathering no bother no drying no cleaning of brushes and utensils. Gives a smooth close shave without tugging or nicking. Useful for removing hair close up to a wound in accident cases.

QUICK FACTS ABOUT THE CLIPSHAVE

The Clip have can be used on A.C. or D.C. and any voltage.

The Clipshave slips in the pocket and the Egyptian dashes anywhere to shave.



No spare parts to keep. Clip have will not cut a nick and it will last over the Clipshave gets monthly with amazing speed.

It lean itself and cannot clog.

The Clip have made in black bakelite case—to be lowered him close with out tugging or scraping.

. . . this belt really retains the Kidney in its proper position

SALT'S PATENT KIDNEY BELT

In more than 30,000 cases, where Salt's Patent Kidney Belt has been prescribed, eloquent proof has been given that this particular support really does retain the kidney in its proper position Thus symptoms due to dragging on the renal ligaments are obviated, while the danger of hydronephrosis—produced by kinking of the ureter—is considerably diminished For these reasons Salt's Patent Kidney Belt has come to be regarded as the standard support for displaced or floating kidney It is described at greater length in Salt's Corset & Belt Book, a copy of which will be sent post free to any Medical Man upon request, together with a special pamphlet on Movable Kidney '

To relieve
PROSTATE GLAND TROUBLE
in ELDERLY PEOPLE

It has long been recognised by the Medical Profession that applications of small continuous electrical currents frequently give relief in the distressing cases of too frequent micturition regarding which they are consulted by patients of advancing age

The small apparatus illustrated is convenient for use by such patients under the direction of their Medical adviser if in his opinion operation is inadvisable The current provided by a small number of dry cells is conveyed through suitable convenient electrodes to the parts affected Shock or accidental excess of current is absolutely impossible. The first cost and maintenance of the apparatus is very moderate

Illustrated particulars post free to Medical Practitioners

HELOUAN SPA

EGYPT'S SUNNY WINTER SPA

The climate and atmosphere of your winter spa are just as important as its actual waters And this is where Helouan is absolutely without rival At the very time when England is at its worst—bleak, wintery and wet—Helouan is at its best beneath a warm Egyptian sun, with exhilarating dry air and delightful nights The setting of Helouan, with the silent desert on one side, the River Nile on the other, is perfect Helouan has its own golf links, too And only twenty-five minutes' journey away is Cairo, and all the attractions of its brilliant season

The curative properties of Helouan's sulphur springs and radio-active waters are well known They are strikingly successful in cases of rheumatism and arthritis, of kidney trouble, obesity and internal disorders, of bronchial catarrh, asthma, of general debility Good hotels and pensions in Helouan are plentiful and reasonably priced Any particular diet can be supplied For full information about Helouan, its hotels and spa treatments, apply to the EGYPT TRAVEL BUREAU, 29 Regent Street, S W 1, or any recognised travel agency

An Endocrine Prescription *in* Dysmenorrhea *and* Amenorrhea

You can write an endocrine prescription in one word — a proper combination of the endocrine principles which are now known to initiate and control the menstrual process. Your prescription will have the advantage of being filled with fresh potent endocrine constituents. The formula is in accord with the most recent research on the endocrine glands concerned in regulating menstruation.

Investigate focal actinotherapy with this new Kromayer Lamp

With the Kromayer Lamp you can effectively apply the amazing bactericidal and regenerative power of ultra-violet rays to septic foci This classical combination of a water-cooled mercury-vapour burner with quartz window and applicators, in a form which you can easily manipulate, will produce actinic reactions—"the most vitalizing of all measures"—on any part of the skin or the accessible mucous membranes Chronic nasal and laryngeal conditions, staphylococcal and streptococcal skin infections, infected wounds, ulcers are among the classical successes of this treatment

Hanovia—makers of the Kromayer Lamp for thirty years—now offer you this superb new outfit, the MODEL IV A self-contained Kromayer Lamp, improved in every particular, yet offered at a lower price A most valuable addition to any practitioner's equipment

Technique Pars Sinusitis

With accurate and careful dosage of U V R the nostrils and post nasal space can be purified and the cells of the mucous membrane stimulated to regain their normal functions Kromayer Lamp, with applicator No 621, full length into each nostril and slowly withdrawn during 3 minutes Change to No 620 and irradiate post nares for 2 minutes Course of 12 treatments may be required with concomitant treatment as indicated

The NEW Kromayer Lamp

MODEL IV

Note these advantages —

The full power Kromayer burner has rheostat intensity control

Any applicator is quickly and firmly attached

The Aggrippa stand gives full range of free movement

The water cooling is automatic

DESOUTTER

CASE RECORDS

Case No H2354/1673 1936

The patient was suffering from muscular hypertrophy of the right leg, the circumference of the calf being twice, and the ankle nearly three times, that of the sound limb The foot was deformed, necessitating a special shoe, and the patient's walk was most ungainly (Fig 1) At the request of the surgeon, Mr Desoutter examined the patient in hospital before amputation to give his opinion as to —

1 *The best site of amputation in view of the peculiar difficulties of the case*
2 *The prognosis from the points of view of appearance and ability to walk well with an artificial limb*

It was decided to amputate 7" below the knee joint and to remove the hypertrophied muscle on the inner side of the leg Figure 2 shows the great success with which the operation was performed The scar on the inner side of the leg, extending from the end of the stump to just under the knee, seemed at first to need special attention, but by very careful fitting of the artificial limb serious trouble was avoided Careful physical re-education played a large part in the success of this case, and the patient now walks very well and has a natural appearance

BRONCHOSPASM AND ASTHMA

A booklet surveying this subject, which includes diagrams and illustrations, has recently been published and has been sent to all members of the Medical Profession. You are invited to send for a copy should this have failed to reach you.

"THE LANCET" writes (28/4/34, p. 929) —

"We have received a pamphlet on 'Bronchospasm and Asthma,' written to bring before the medical profession the value of Felsol in the treatment of asthmatic subjects. The powders can be prescribed by the medical man in accordance with the definite regime which he decides to adopt in the treatment of a case, the claim for felsol being that its administration relieves promptly the attack of asthma by its influence over bronchial spasm, so that only the most severe cases would require the injection of morphia."

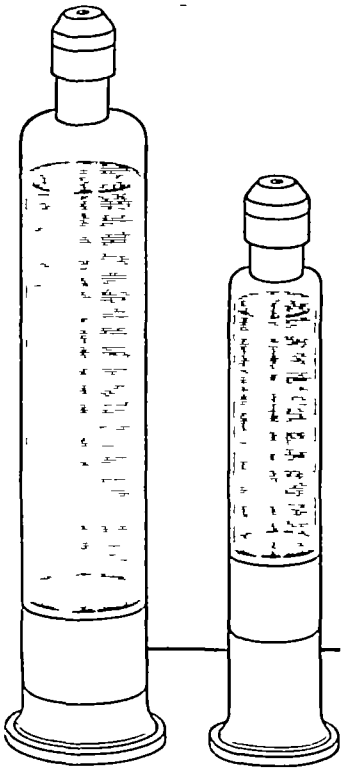
Head off the secondary complications!

STREPTOCOCCUS ANTITOXIN (SCARLATINA)

GLOBULIN *Lederle* MODIFIED



THE COMPLICATIONS OF SCARLET FEVER may be divided into two classes—

1. Those which are of pyogenic origin and which usually appear with the eruptive stage and include abscess formation adenitis and otitis media
2. Those which are not of pyogenic origin and which usually appear after the acute symptoms have subsided and include arthritis glomerulonephritis and purpura hæmorrhagica

Antitoxin is effective in heading off the complications in both of these groups—particularly gratifying results have been obtained in preventing those complications that appear later and tend to become chronic.

The new GLOBULIN MODIFIED ANTITOXIN *Lederle* is a highly purified concentration and standardised material permitting a 40% volume reduction in the dosage together with a pronounced decrease in serum sickness expectancy The prophylactic dose is contained in 1 c.c and the therapeutic dose in 3 c c. of this material The rate of serum sickness has been reduced from 23% to 12% (only 2% severe) and the only obstacle to universal routine use of antitoxin has been thereby removed

Antitoxin should be administered *early* (first or second days) Whether or not antitoxin is administered should not be determined by the severity of the infection as observed after a wait of perhaps five days Early antitoxin administration will determine a milder clinical course and prevent serious complications

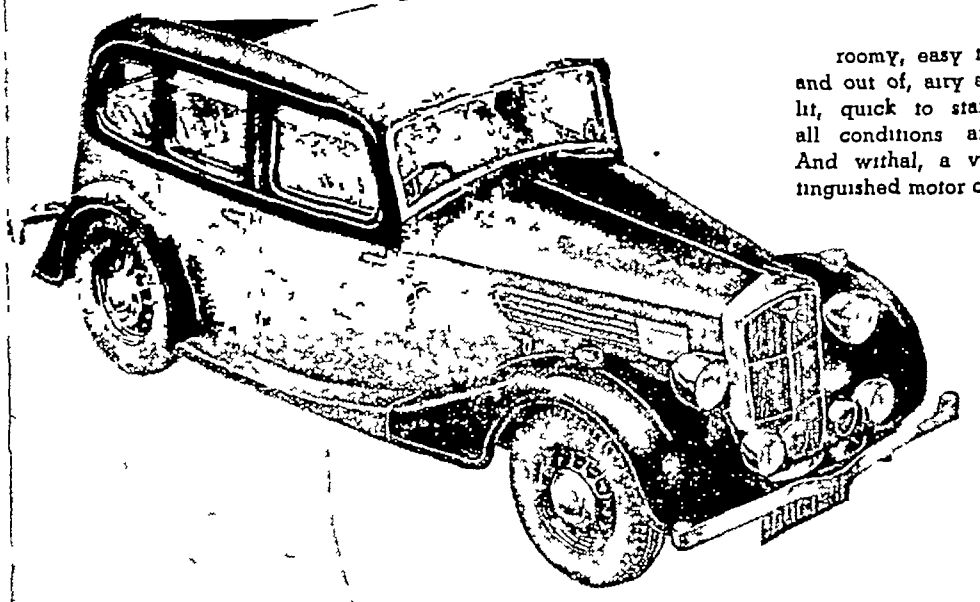
ANAHÆMIN B.D.H.

In the treatment of pernicious anæmia

In the majority of cases of pernicious anæmia treated with Anahæmin the response is so certain that, in the words of one well-known physician, 'it is possible almost to guarantee a rise of half a million in red blood count weekly from a weekly 2 c.c. injection . . . indeed, this dose seems usually to be too large . . .'

On the other hand, some physicians arrange their own scheme of dosage, one such physician states 'I give 4 c.c. in a week leaving off all treatment for about six weeks . . . I have had excellent results . . . Anahæmin has never let me down . . . it is easily the best liver preparation'



In either event, whether the orthodox or a special dosage be adopted, the blood count in average cases is restored to normal within a few weeks, after which period it can be maintained by monthly injections of 2 c.c.

COATES & COOPER LTD, 94 CLERKENWELL ROAD, LONDON, EC 1

★ for the PALE CHILD

A palatable, odourless, almost tasteless form of iron

In variable weather it is especially important to raise the tone and vigour of the "pale child" by increasing the haemoglobin and red blood cell content of the blood. Between the pressure of school work and play and the discomfort of changing temperatures, the anaemic child urgently needs blood reinforcement and invigoration. Only iron can do that, but it must be in a form which a capricious child will take willingly.

Ovoferrin meets the needs of the blood hungry child. Palatable, odourless and almost tasteless, children take Ovoferrin gladly whereas they rebel at the nauseating irritating organic salts.

Ovoferrin is noted as a rapid and certain builder of haemoglobin and red blood cells. It stimulates the jaded appetite, it does not constipate, it does not stain the teeth, and it is retained by the most sensitive stomach. The dose for children is one or two teaspoonfuls in milk or water, with meals. Each tablespoonful, the adult dose, contains one grain of easily assimilable metallic iron in colloidal form held in this state by means of a protective protein colloid. Ovoferrin is prescribed in 11 ounce bottles. Trial bottle on request.

Bowel Treatment of Surgical Cases

THE use of purgative agents before operation is now disfavoured by many surgeons who prefer the patient to have a short preparatory course of lubrication therapy. "Cristolax" is advocated for its lubricant and gentle laxative effect as well as its digestive and nutritive value. Clinical experience has definitely proved its worth.

For the regulation of the bowels after operation "Cristolax" offers many advantages. Its bland soothing yet efficient action diminishes peristalsis and does not irritate the line of suture nor give rise to meteorism as many cathartics are liable to do.

Cristolax is medicinal paraffin of the highest purity and correct viscosity so skilfully combined with "Wander" Dry Malt Extract that all unpleasant oiliness is entirely eliminated. Its routine use during convalescence restores normal bowel action.

"ARGYROL" TABLETS

BRAND SILVER VITELLIN

for convenient, exact, fresh solutions

Today many physicians find great convenience in the use of Argyrol tablets These tablets are pure Argyrol Brand Silver Vitellin, no binder being used They not only insure accuracy, purity and genuineness but also save time because a fresh, potent solution is thus made available at a moment's notice in the doctor's office, in the operating room and at the bedside Argyrol is a unique compound It is interesting to note that among the mild silver proteins on the market there is a wide variation in hydrogen ion concentration from less than seven to more than eleven This means that some products are very much more alkaline than others This fact no doubt has much to do with the irritation noted by doctors when Argyrol substitutes are used in place of Argyrol Argyrol's hydrogen ion concentration is always close to nine regardless of the solution used Argyrol is not only an efficient bactericide, it has the tremendous advantage of being non-irritating and sedative to inflamed mucous membrane and it possesses the further advantage of being absolutely harmless to the most delicate tissues

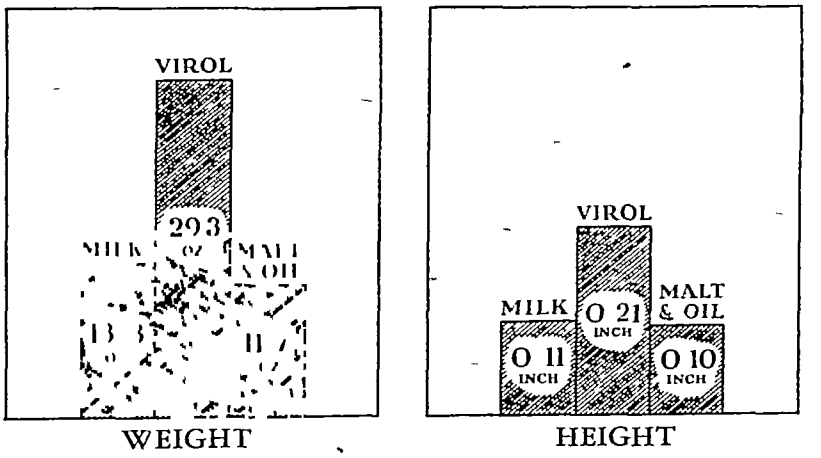
DIETARY DEFICIENCIES



AND THEIR TREATMENT

It is widely recognised that the diet of children of school age is in general by no means complete, but that the deficiencies are of a multiple nature is not so fully appreciated

An investigation recently published in the medical press* has shown the extent to which supplements designed to counteract such deficiencies assist growth 864 children from schools in the North and South of England were given in turn, as additions to their ordinary home diet, either milk, or cod liver oil and malt extract B P , or Virol, or else no supplement Each supplement was given for one term to three-quarters (648) of the children The daily quantities given were of equal calorific value, and the experiment lasted for one school year The following diagrams show the additional gains in weight and height of the treated children over the controls—

Additional gain over "no supplement"

(Mean of 648 children—per school year of 39 weeks)

The superiority of the results obtained with Virol is at once evident, and demonstrates how the correction of multiple dietary deficiencies can be achieved by the use of a physiologically balanced preparation Judged by the standard of so good a food as milk, the excellence of Virol is all the more striking In all those children whose multiple dietary deficiencies need correction, Virol will evoke a maximum response Only by giving a *complete* supplement is it possible to ensure this result

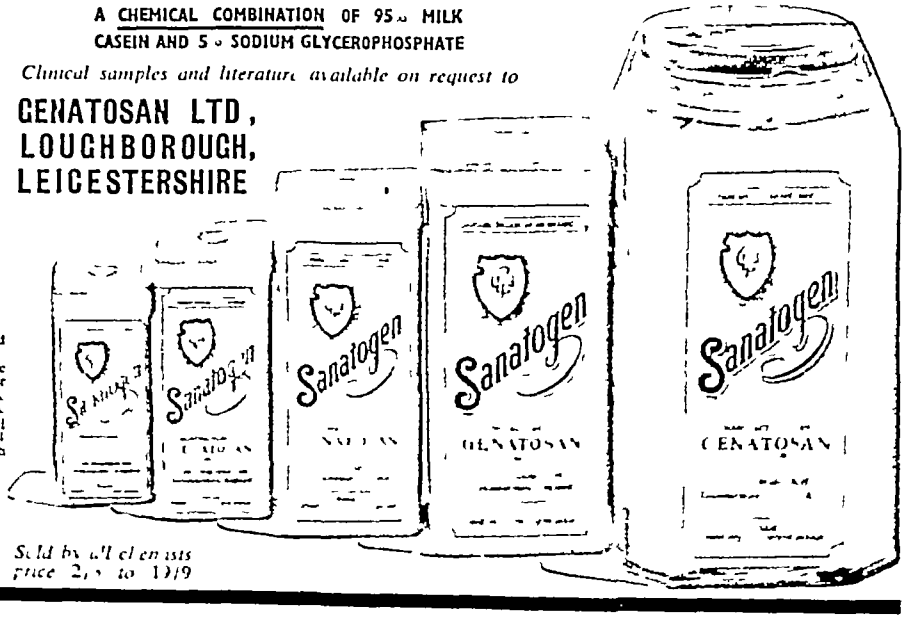
* *The "Medical Press & Circular," 27th October, 1937 A reprint of the article will gladly be sent on application to Virol Ltd , Hanger Lane, Ealing, W 5*

Convalescence

In convalescence a tonic is required that will co-operate with, and augment, the natural recuperative powers of the body, rather than one which will have only an immediate stimulating effect. In the latter case there is always the danger of disappointment, due to an artificial improvement that the natural powers are unable to stabilise.

Medical evidence extending over many years has established the value of Sanatogen in promoting convalescence. In "The Elements of Pharmacy, Materia Medica and Therapeutics" Sir William Whitla writes —

> "*The interesting and valuable researches conducted by Tunnicliffe and Beddoes upon metabolism, in which Sanatogen was experimented with, establish the fact that its organic phosphorus is almost entirely assimilated when the food is administered in the amount necessary for the needs of the body. When given in addition to other food, the amount of nitrogen and phosphorus retained in the organism is increased, the tissue metabolism is more complete, the constituents of the ordinary food being more thoroughly utilised, appetite is increased and the body weight augmented.*"



Similarly gratifying observations are constantly being notified, and, as Sanatogen is entirely free from fats, sugars and carbohydrates, it can safely be prescribed in all types of cases. It is rapidly and easily digested and assimilated, even in cases exhibiting severe gastric inflammation, and for this reason it is a valuable addition to enemata. It can be added to any non acid beverage or food, and, consequently, monotony in its administration can always be avoided.

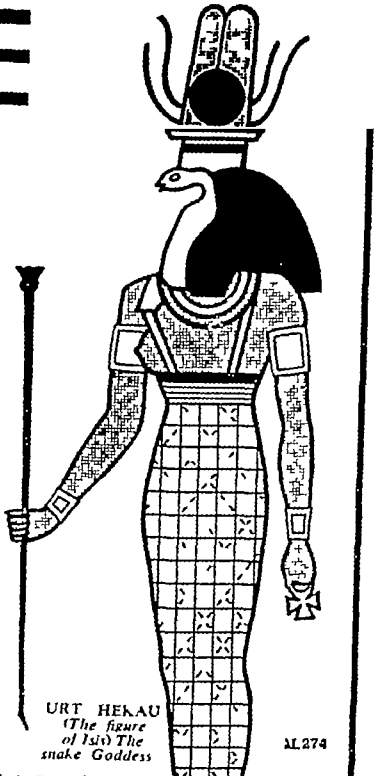
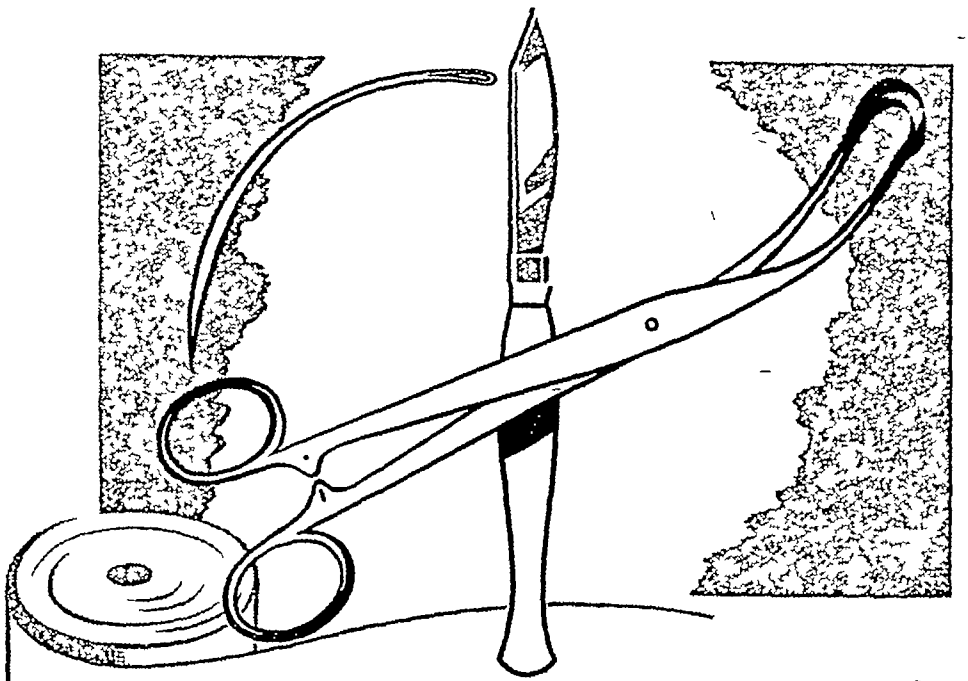
OVALTINE

BEFORE AND AFTER OPERATIONS



THE use of Ovaltine before a major operation is of great service in helping to build up the system against the strain involved by operative interference In abdominal cases especially, where a light and unirritating diet is necessary, the use of Ovaltine alone for a few days before the operation will be found sufficient to maintain the patient's nutrition at a sufficiently high level

After severe operations the regular use of Ovaltine is of the greatest service on account of its bland nature its ready digestibility and its highly nourishing and sustaining properties



Ovaltine is a complete food composed of fresh full-cream milk, eggs and malt extract in the form of crisp granules which dissolve readily in milk to form a delicious beverage acceptable to the convalescent patient

THE PHYSIOLOGICAL VALUE OF THE BANANA

II. Protein: The proteins in plants are biologically inferior to the proteins from animal sources, because they do not yield *all* the varieties of nitrogenous bodies (amino-acids) demanded by the human organism for full development

But, while incomplete, they have a full caloric value, and are useful in diluting the complete proteins of animal origin A leading authority states that about half animal and half plant protein gives the best biological value in a diet

The amount of protein—average 1·3 per cent —is higher in the banana than in the majority of raw fruits

NB In the fully ripe banana the starch content is reduced to about 3 per cent having been converted into soluble sugars A banana is ripe when all green has disappeared from the skin and brown spots have formed upon the yellow surface

PRICE - 4/6 per 4 oz bottle

Sample and Literature on request.

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres Recent knowledge has shown the interaction of nervous vegetative system and endocrine system, and on this knowledge SERENOL is based. It is thus a biological, not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc

Serenol is given in the following dosage For mild cases one to two dessertspoonsful on retiring For more severe cases one dessertspoonful at 10 a m , one dessertspoonful at 4 p m and two dessertspoonsful on retiring

Serenol, being a biological sedative containing no barbiturate, is not habit forming

Proved efficiency with *pleasantness*

In spite of its high germicidal efficiency (Rideal-Walker 3 0) 'Dettol' can be used at strengths impracticable with carbolic and cresylic antiseptics It is non-poisonous, non-staining, pleasant smelling It has been shown that when 30% 'Dettol' is rubbed into the hands and allowed to dry the skin remains insusceptible to infection by haemolytic streptococci for at least two hours, unless grossly contaminated 'Dettol' is also stable in the presence of blood, pus, faeces and other organic matter

Obtainable from chemists in 1/-, 1/9 and 3/- bottles, and in larger sizes for medical and hospital use These prices do not apply in the Irish Free State and Overseas Samples and full information on request

Towards national health —

"National Health cannot be attained or maintained without food that is adequate both in quantity and in quality."

(Annual Report of the Ministry of Health 1936-1937 p 49)

The imperative need for the nation to choose its foods wisely is a theme which is attracting considerable attention, and in this connection emphasis is placed on the importance of vitamin-containing foodstuffs

Members of the medical profession appreciate the dietetic value of Marmite—the yeast extract rich in vitamin B_1 and B_2 complex

Marmite is prescribed extensively with beneficial results in preventive and curative medicine, it is ordered particularly when vitamin B therapy is indicated and in certain forms of anaemia

The Typical Arthritic

The commonest type of arthritic that the physician is called upon to treat is not, as a rule, seriously incapacitated There is often considerable discomfort, but the joint involvement is slight, and the patients usually cannot be induced to undergo an expensive course of hospital treatment

For this type of patient 'Calsiod' (calcium ortho-iodoxybenzoate) is an effective analgesic and palliative It is safe and non-habit-forming No serious reactions to liver or kidneys have ever been reported following its use

In addition to its therapeutic value in various types of arthritis, 'Calsiod' has a wide field of usefulness in that large group of patients complaining of 'rheumatism,' 'lumbago,' 'gout,' 'neuritis,' 'fibrositis,' etc.

PEAS

A typical example of the high nutritive values retained in Heinz Strained Foods. (Figures show percentages on the wet basis)

Vegetable and fruit purées, rich in mineral salts, vitamins and other soluble nutriment, constitute the perfect diet for infants and cases of nutritional anaemia

But despite the wide approval shown by physicians, and a growing appreciation of this dietary by mothers, progress has hitherto been slow, owing to the practical difficulties encountered in home preparation

The use of vegetables not truly fresh, mechanical losses through oxidation when boiling, and inefficient sieving out of the harsh fibres, inevitably impair the quality of the home produced preparation

Now, with the marketing of a range of strained foods by H J Heinz Co Ltd, vegetable and fruit purées containing all necessary dietetic values are available in convenient bulk and form

Heinz Strained Foods are prepared with all the advantages of the best factory method The vegetables are specially grown in those areas where soil and climate combine to produce the best, they are harvested when they are just right, and cooked within a few hours of being garnered

First, the ingredients are scrupulously cleaned Cooking by light steam pressure in vacuum containers follows, leaving the contents perfectly disposed for comminution by extrusion, and at the same time ensuring retention of the essential juices and mineral constituents Fine sieving having removed all fibres of a harsh or irritant nature, the purée is then adjusted to an acceptable consistency and sealed in vacuo, the sealed containers being immediately subjected to sterilization under constant conditions of time and temperature

The purées thus offered are uniform, convenient and of the highest possible nutritive content

NOTE *Glass containers are not used owing to the deleterious effect of light on the value and palatability of the purees*

H J HEINZ COMPANY LIMITED, HARLESDEN, LONDON, N W 10

may be quite impossible to distinguish between a simple bone cyst, a chondroma, and a benign giant-cell tumour without the aid of the pathologist

Fibrocystic Disease and Sarcoma

In fibrosis, or fibrocystic disease, of bone, extensive translucent areas, often multilocular, are seen, frequently involving more than one bone The cortex may be thinned and expanded around the translucent areas, and there may be evidence of old fractures or of bending of the bone Hypercalcaemia and increased urinary output of calcium will differentiate parathyroid disease from simple fibrosis of bone The *x*-ray appearances of multiple exostoses (diaphyseal aclasis) are sufficiently characteristic to call for no detailed description here Many bones may need to be radiographed, and the frequent association of this condition with multiple chondromata of the hands and feet must be looked for

The chronic inflammatory conditions such as Brodie's abscess, typhoid abscess, etc, may be identified from the general x-ray appearances, from the previous history, and from the frequent presence of periosteal reaction resulting in localized thickening rather than expansion of the bone In cases where the central bony translucent area is less clearly defined than in the foregoing the possibilities which have to be considered (provided an acute or subacute inflammatory lesion can be ruled out) are osteolytic sarcoma, Ewing s tumour, and osteolytic metastatic carcinoma

Bone sarcomata are usually single lesions, primary in origin, though occasionally they may occur as metastases from a sarcoma in another bone They are found as a rule in patients under the age of 30 years, but may occur later There may or may not be a history of trauma, there is pain, and pathological fractures are common The limits of the translucent area are irregular and ill defined There may or may not be signs of periosteal reaction, but there is no evidence of expansion Any part of the bone may be affected, more usually the lower end of the femur or the upper end of the humerus or tibia In the earlier stages, when the diagnosis is of such paramount importance, and sometimes later, sarcomata may be erroneously diagnosed as benign giant-cell tumour, or even as osteomyelitis, especially if accompanied by pyrexia and leucocytosis The help which might be given by the pathologist in these difficult cases is often not available owing to the reluctance of the surgeon to remove from the tumour a specimen for pathological examination, because of the risk of stimulating a possibly malignant tumour and of disseminating it through the blood stream Whether the histological findings following such an exploratory operation would justify the taking of this risk is a question that I hope will be made clear by the pathologist and the surgeon in this discussion My own feeling is that in those cases where the clinical history, the physical examination, and the radiological appearances are so indefinite as to leave the diagnosis in doubt the risk of a biopsy should be undertaken

EWING S SARCOMA

From the varying accounts of the radiological appearances ascribed to Ewing s sarcoma by different authors two main types emerge—namely, the osteolytic type, which merits consideration here, and the hyperplastic type, which will be dealt with under changes of contour The former type has been aptly described by Herendeen as presenting an appearance suggestive of 'rubbing out' of part of the bony shadow by an india rubber The early age incidence, the ill defined edges of the translucent area, and the tendency to spread up the medullary cavity may suggest its nature, but the only true test is the radiotherapeutic one As Herendeen has pointed out, 'a bone tumour which fails to disappear under *x* ray treatment is not a Ewing s tumour' The dosage required for this response is usually a comparatively small one—about 1,000 *r* Confirmatory evidence is found in the tendency to metastasize in the lungs and in other bones, the metastases in the bones showing the same ready radiosensitivity as the primary tumour

Multiple myelomatosis will be suspected from the multiplicity of the translucent areas, their widespread distribution, their often clear cut outlines, the absence of expansion or periosteal reaction, and the frequent presence in the urine of Bence-Jones proteoses

Metastatic carcinoma may reveal itself as isolated translucent areas with margins which are usually ill defined and irregular, and with no expansion or periosteal reaction in the overlying bone Pathological fractures are common The usual multiplicity of these lesions, with often a past or present history of a primary tumour in breast, kidney, lungs, or elsewhere, supplies the diagnostic clues Not infrequently, however, the primary tumour is silent and remains undiscovered

The next type of translucency that demands our attention is that which, for want of a better term, we will call "patchy" This represents the numerous translucent areas of different size and shape which may be seen in a bone, some of them contiguous, some even coalescing This change may be demonstrated in simple disuse decalcification, in osteomyelitis, in sarcoma, in Ewing's tumour, or in metastatic carcinoma The first two call for no special comment here The last three may be difficult to differentiate The younger age of the patient and the greater tendency towards periosteal reaction in sarcoma may serve to distinguish it from metastatic carcinoma In both there is a proneness to cortical destruction and to pathological fracture The Ewing's tumour may be differentiated on the lines already indicated

Alterations in Contour

The changes produced by simple osteomata, traumatic osteomata (erroneously called 'myositis ossificans traumatica"), the single exostoses (osteochondroma), and multiple exostoses (diaphyseal aclasis), whose appearances are as a rule unmistakable, call for nothing more than a casual reference here

The "expansions" caused by simple cysts, fibrosis of bone, chondromata, and osteoclastomata are changes of contour to which reference has already been made The difficulty arises when the bony shell gives way and the translucent medium invades the soft tissues, for then we may be at a loss to decide whether a lesion is sarcomatous or not

The most important type of change of contour which we have to consider is what may be designated 'sub periosteal bony proliferation' This change may be found in such varying lesions as simple periostitis, syphilitic periostitis chronic pyogenic, tuberculous, or typhoid osteomyelitis, sarcoma, and Ewing s tumour

The clinical history the signs, the symptoms, and the radiological changes in the bone itself will usually serve to distinguish an osteomyelitis But from the purely radiological point of view it may be extremely difficult to differentiate between the other lesions mentioned, especially in their earlier stages One can indicate here the value of repeat radiographs in such cases For the

A prescription you will endorse

As a medical man you will appreciate the efficacy of a throat pastille made to the following formula:—*Menthol 0·78%, Ol M Pip 0·33%, Chlorof 1·30% Benzoin 0·28%, Licorice Pastille Base ad 100%*.
Add to that the fact that Meggeson & Co Ltd. have been making medicated pastilles for over 140 years and you will agree that here is a handy convenient remedy which you can be happy in prescribing

FAMOUS SINCE 1796

diagnosis of syphilis one resorts to the Wassermann test but one must bear in mind that a syphilitic taint does not render its possessor immune to sarcoma In spite of a positive Wassermann reaction the lesion may still be sarcomatous Only if the lesion clears up under strenuous anti syphilitic treatment are we justified in regarding the diagnosis of syphilis rather than sarcoma as clear Radio therapeutic measures may be adopted to establish a diagnosis of Ewing's tumour but we must bear in mind that such measures may modify the subsequent development of a sarcoma so that its ultimate diagnosis may be masked.

The palisade or sunray spicules of a sarcoma may appear eventually and so clinch the diagnosis but one's conviction is that by the time this has happened it is probably too late for the patient's life to be saved One must also appreciate that palisade spicules may be found in the lattice type periostitis of syphilis In the sclerosing type of sarcoma the sunray spicules may be so dense as to obscure the texture of the underlying bone completely In the absence of palisade or sunray spicules a case showing periosteal proliferation in which the palpable tumour is much in excess of the bone changes should convey a suspicion of sarcoma

Conclusion

My aim has been to stress the fact that whilst in my opinion the radiological examination is probably the most informative single investigation that can be made in a case of bone tumour it is only one link in the diagnostic chain If the radiologist has the opportunity to examine not only his radiographs but also the patient, he may have sufficient evidence in his hands to justify a firm positive diagnostic opinion which cannot be shaken If only the radiographs are available to him the bone changes presented may be distinctive enough to justify him still in making a firm positive diagnosis But if he is in doubt he should not hesitate to say so, and to leave it to others to add to the information he is able to give and so arrive at a diagnosis on the accumulated evidence A final warning may be given regarding the frequent fallacies of a spot diagnosis I would emphasize the necessity for an orderly routine examination of the bone changes presented on the radiograph with as far as possible, a translation of these bone changes into terms of pathology And finally I would urge a careful correlation with these bone changes of all the known facts as to age clinical history physical examination and pathological and biochemical investigations

The *Times* of December 8 contained an article on the past present and future of Queen Mary College by Sir Lynden Macassey chairman of its Governors From small beginnings in 1887 the technical school beside the People's Palace in Mile End Road became the East London Technical College and was recognized in 1907 by the University of London as a School of the University in the faculties of arts science and engineering and soon afterwards changed its name to East London College Largely through generous support by the Drapers Company a new scheme was granted by the Charity Commissioners and the institution received a Royal Charter on December 12 1934 under the name Queen Mary College The consistent aim of the college since 1907 has been to provide full facilities of university education at the doors and within the means of young people of East London in the faculties of arts science and engineering and in conjunction with the London Hospital Medical School, in medicine at the University of London

PROGRESS OF DIPHTHERIA PREVENTION*

A SURVEY AND SOME RESULTS

BY

J GRAHAM FORBES, M D, F R C P, D P H

Principal Assistant Medical Officer Public Health Department L C C

It was just nine years ago, at the Annual Meeting held in 1928 at Cardiff that I had the privilege of taking part in the discussions on this subject The movement in recognition of the value of prophylactic inoculation which at that time was already gaining ground is now generally regarded as having justified the beliefs held ten years ago by its being adopted in an increasing number of places where diphtheria continues to be a serious menace to child life As evidence of the marked extension of diphtheria prophylaxis in England and Wales two statements made in the House of Commons at an interval of nearly seven years by Ministers of Health may be compared One on December 9 1930 was to the effect that provision for Schick testing and immunization had been sanctioned in thirty-eight districts in England and in two in Wales and that similar facilities had been afforded in some other areas, the other on July 29, 1937 stated in answer to an inquiry that preventive action by immunization against diphtheria had been taken in approximately seventy-four county boroughs 117 non county boroughs twenty eight metropolitan boroughs and five counties in England and Wales The extent of that progress may also be judged from the comparisons afforded by the period from 1930 to 1935 and the year 1936 in a selection of fifty large towns with populations averaging 184 000 and ranging from 40 500 in Dover to over a million in Birmingham totalling in 1936 nearly 9½ millions inclusive of about 2 millions or more under the age of 15 Up to the end of 1935 the adoption of immunization in those towns for varying periods had resulted in a total of over 372 500 protected with the addition in 1936 of a further 86 500—in all nearly 460 000 chiefly children of school and pre school age representing 5 per cent of the total population and possibly some 22 per cent of the child population under 15

The individual proportions based on estimated 1936 populations however, differ widely in the various centres of preventive work ranging from 10 to 1 per cent immunized among the fifty towns Chester heads the list with 10 per cent—4 500 having been immunized in a total population of 45 000—succeeded by half a dozen towns with protection rates of between 8 and 9 per cent Birmingham 8 8 per cent., with over 90 000 immunized, Walsall 8 4 with 9 200 Worcester 8 4 with 4 500 Leeds 8 22 with over 40 000 Manchester 8 2 per cent with about 61 000 and Chatham 8 0 with 3 500 Then come in order Wood Green 7 9 with 4 200 Wakefield 7 5 with 4 500 Salford 7.3 with 15 000 Blackburn and Swindon, 7 per cent with respectively 8 300 and 4 200 Cardiff 6 8 per cent with over 15 000 and Acton also 6 8 with 4 700 while Liverpool with about 39 000 immunized shows a proportion of only 4.5 per cent in a total population of 847 000 (As the child population under 15 is approximately one quarter to one fifth that of the total population and as the majority immunized belong to the child age group a rough estimate of the proportion protected of the child population may be obtained by multi

plying the immunized percentage of the total population by 4 5—thus Chester reaches 45 per cent and the remainder fall considerably short of the desired 60 per cent to affect the general incidence of diphtheria)

In London, with a population of 4,400,000 in 1930 and 260,000 less in 1936, immunization work has been to a very large extent, so far as the child population is concerned, the separate responsibility of the medical officer of health of each of the twenty nine metropolitan boroughs, most of which now afford facilities for immunization in their clinics and welfare centres or through private practitioners

18,500 cases and 1,031 deaths and the still lower figures in 1936 of some 15,100 cases and 951 deaths—showing a fall of 6,400 cases and 174 deaths , while in London the difference has been more marked, with over 13,400 cases and 452 deaths in 1930 falling in 1935 to under 9,300 cases and 271 deaths, and in 1936 to 7,030 cases and 226 deaths —a drop in incidence and mortality of 50 per cent But in view of the generally small ratio of protected being less than 6 per cent , it is unlikely that these reductions in incidence and mortality have been to any extent attributable to the influence of immunization, particularly in London, where the proportion of immunized is little

GRAPH I —*Diphtheria Mortality Rates in New York and London with Number of Deaths on Each Point of Curve*

The number immunized from January 1929 to June 1935, was 1 114 325 representing 65 per cent of the total population under 15 years and including 65 to 70 per cent of the 650 000 under 6 years of age
Populations —New York 1920 5 620 000 all ages (1 592 2 00 under 15) 1930 6 955 000 all ages (1 688,200 under 15) 1936 7 363 600 all ages London, 1920 4 520 000 all ages (1,151,000 under 15) 1930 4 400 000 all ages 1936 4,141 100 all ages (933 000 under 15)

In 1930 provision had been made in fourteen of the twenty-nine boroughs, yielding a total of some 9,000 protected children, as compared with about 32,000 at the end of 1935 and an additional 8,000 in 1936—a proportion of only 4 2 per cent of the 933 000 population under 15 To this total, however, must be added over 3,000 children who have been immunized between 1932 and 1936 in the residential schools under the London County Council s control and some 7,000 protected in institutions in previous years, bringing the London total up to about 50,000, or 5 3 per cent of the child population

Only thirty of the fifty towns had adopted any preventive scheme in 1930, and the numbers then protected amounted to 60,200, or less than 1 per cent among a population of under 7 millions In that year, one of generally higher diphtheria prevalence, the fifty towns yielded a total of 21,500 cases and 1,125 deaths, as compared with 1935 s record in a more normal year of under over 1 per cent of the total population Despite a seven fold increase since 1930 in the numbers of protected individuals in the fifty towns concerned, a very much larger increase in the protection rate is necessary to bring about any decided fall in diphtheria attack and death rates, such as has been effected in the two examples to be described in the cities of New York and Montreal

In addition to the preventive measures in large town centres, mention must be made of the fact that a number of the county authorities in England have adopted immunization in their urban and rural clinics, schools, and welfare centres A by no means complete survey of recent annual reports provides examples from Northern, Midland, Eastern, Western, and Southern areas of such work proceeding in sixteen counties among a total population of over 12 millions, but with very varying response Most notable have been the efforts since 1932 of the medical officers in the West Riding of Yorkshire

PIGEONS AS POSSIBLE TETANUS CARRIERS

BY

A WILSON RUSSELL, M D, D P H

Senior Resident Medical Officer Infectious Diseases Hospital Portsmouth

The following case seems to be of more than ordinary interest. The great bulk of work done on tetanus in recent years deals with serum treatment to the exclusion of aetiology, although a number of cases of "idiopathic tetanus have been published These have been cases in which the site of entry of the infection has not been found (dental, etc), but I have failed to discover any record in which pigeons have been concerned in its transmission

Case History

A baby girl aged 18 months was admitted to the Infectious Diseases Hospital on June 11, 1937, as a case of meningitis She had been perfectly well until the day previous, when the parents noticed that she had difficulty with her food, which was attributed to her being feverish

On admission she was quite conscious, and had a temperature of 102 6 , a pulse rate of 164 and a respiration rate of 30 The neck was a little stiff, but Kernig s sign was absent The upper and lower extremities were slightly spastic in extension with carpo-pedal spasm and the plantar responses were extensor in type There was ptosis of the left eye and well marked trismus, the teeth being tightly clenched in tonic spasm Pronounced scabetic lesions were present on wrists, feet and ankles, and waist-line A diagnosis of tetanus was made, and 20,000 units of antitetanus serum were given intramuscularly and a further 20 000 units intrathecally The cerebrospinal fluid was quite clear and under no pressure, 10 c cm being withdrawn The following morning 15 c cm. of fluid were withdrawn and 20 000 units of antitetanus serum given intrathecally and 20,000 units intramuscularly She had had one short fit during the night The temperature rose to 103 4 , and six short spasms lasting three to four minutes each occurred in the course of the morning. During this period she was given sips of glucose water from a spoon Death ensued in the early afternoon, twenty hours after admission

Results of Investigation

The cerebrospinal fluid was reported as being sterile and quite normal chemically Apart from some congestion of brain and kidneys no abnormality was found on post mortem examination, and the only skin damage was the sores and scratches as the result of scabies. These were so numerous that it was impossible to localize the site of entry of the tetanus infection

Investigation of the possible source of infection revealed the following facts Scabies had occurred in all the members of the family, but had affected the baby last The father of the child is a pigeon fancier with about forty racing pigeons, which are housed in a large loft in his garden He is scrupulously careful regarding the cleanliness of the loft and uses the pigeon droppings as manure for the garden No other kind of manure (horse, etc) has been used for years The child was in the habit of playing in the garden and had been crawling about on the grass below the pigeon loft.

Specimens of soil from the ground below the loft were examined and tetanus bacilli recovered from two out of four samples. Specimens from each of the two main sections of the loft were taken and tetanus bacilli were obtained from one of the samples of droppings These samples were taken on June 14—that is two days after the death of the child By segregating the pigeons in the positive section of the loft first into two groups of fourteen birds and twelve birds, it was found that in the twelve-bird group one bird alone was passing tetanus bacilli This positive specimen was obtained on June 28—that is, sixteen days after the child s death This pigeon was isolated until a specimen of droppings examined three weeks later (July 17) failed to yield tetanus bacilli

Comments

After searching the medical literature I have been unable to find a similar case recorded in which pigeons could be associated in the aetiology of tetanus Veterinary authorities state that "the fowl is very resistant (Gaiger and Davies, 1932) Wooldridge (1934) says that tetanus bacilli can be recovered from the alimentary tract of horses, cattle, sheep, goats, pigs, and dogs, and that these animals can develop clinical tetanus I have, however, failed to find a reference in which tetanus bacilli have been recovered from the alimentary tract of the pigeon The resistance of birds to tetanus is often quoted by bacteriologists as an example of natural species immunity Quoting Abel Zinsser (1922) states that birds, while immune against the ordinary dangers of tetanus bacilli, may be killed by experimental inoculations with very large doses of tetanus toxin'

The findings of this particular case would indicate that pigeons can be 'carriers' of tetanus, and seem to be of interest from both the medical and veterinary points of view

Summary

A fatal case of tetanus in a young child of 18 months is reported The incubation period was very short (twenty-four hours at the most), and death ensued in about forty-four hours from the onset of the illness

The typical clinical signs were exhibited, and large doses of antitetanus serum intramuscularly and intrathecally were given at the earliest opportunity

The subsequent investigation seems to implicate a pigeon (or pigeons) as a "carrier' of tetanus

No animals were available for inoculation tests with the tetanus bacilli obtained on culture from the pigeon s droppings, but the evidence otherwise would suggest the following chain of events

1 The pigeon became infected with tetanus bacilli probably by pecking horse manure and became a carrier passing the bacilli or spores in its droppings, although showing no sign of illness itself

2 The droppings infected the ground below the pigeon loft

3 The child playing on the ground below the loft became infected through the skin which was broken and scratched, due to active scabies

4 The child developed clinical tetanus and died after a very brief illness.

I should like to acknowledge my indebtedness to Dr J A D Radchffe who did all the bacteriological work in connexion with this investigation.

In the forty eighth annual report of the county medical officer for the West Riding of Yorkshire it is announced that arrangements are being made for the estimation of the alcohol content of the blood to be carried out in the county laboratories when necessary Recent legislation in Germany has made submission to this test compulsory in all cases of alleged drunkenness while in charge of a motor car

where it is recorded that among a total population of over 1¼ millions including a school population of approximately 218 000 nearly 91 500 have been protected or were under treatment up to the end of 1936 representing roughly 25 per cent of the child population

All this is to the good in the aim to reach 50 per cent of the number of children born each year, but the proportions at present protected are insufficient yet to reduce total incidence and mortality The evidence however in favour of immunization, which now few will gainsay has been clearly demonstrated by the very pronounced lower incidence and almost complete absence of fatal diphtheria among the immunized as compared with records among the non immunized—amounting where sufficient numbers for comparison are available to an attack rate ten or twelve times less among the protected The benefit to the protected individual and the relief from anxiety to the parent cannot be denied

The important question is whether one is justified in resting satisfied with what is being achieved and in being content that nothing further can be done to bring about a real reduction in the heavy toll which diphtheria annually exacts in life and health of our child population in England and Wales with a yearly average for the past ten years of over 55 200 cases and 3 120 deaths and in London with over 10,300 cases and 345 deaths The answer must surely be emphatically in the negative In support of that response I would draw your attention to two striking examples illustrated by Graphs I and II of persistent and well organized effort followed by so notable a fall in diphtheria incidence and mortality as to be attributable with little doubt to those efforts

GRAPH II—*Diphtheria Mortality Rate in Montreal with Number of Deaths on Each Point of Curve*

The number immunized from 1928 to 1935 was 110 463 which in 1936 equalled 56·5 per cent of the population aged 1 to 12 years

New York Diphtheria Control

In New York between the years 1929 and 1935 as the result of a sustained and intensive anti-diphtheria campaign a total of over 1 110 000 children under the age of 15 were immunized in addition to those protected by the efforts of previous years The total population of New York had risen from 4¼ millions in 1910 to over 5½ millions in 1920, and those under 15 years from less than 1 370 000 to nearly 1 600 000 with an average of close on 14 700 cases of and 1 300 deaths from diphtheria, a mortality of 25 per 100 000 of all ages

Between 1920 and 1929 whilst concerted immunization work was in progress but not yet directed particularly to the children of pre school age under 5 years there was a yearly average of 10 700 cases and 700 deaths (11·2 per 100 000) In 1929 when a fresh campaign was instituted and extended especially to the protection of those under 5 years of age there were just over 8 500 cases and 463 deaths From 1930 to 1932 the cases of diphtheria fell by over 50 per cent to 3 500 to 4 000 and deaths to under 200 In each subsequent year this fall has steadily continued coincident with the increasing numbers immunized until in 1936 the remarkably low figures of 1 143 cases and thirty five deaths were recorded showing a death rate of only 4·7 per million in a total population of over 7 360 000, including about 1 800 000 children under 15 among whom the death rate was only 21 per million as against 274 per million in 1929 and 117 in 1930

During the period of this campaign the numbers immunized rose from just on 212 000 in 1929 to reach a total of no less than 1 114 325 in the middle of 1935 attended by a reduction in incidence to nearly one eighth and in mortality to about one thirteenth of the toll diphtheria had taken in 1929 when the campaign opened It is also estimated that of the 650 000 children under the age of 6 years between 65 and 70 per cent have been protected

Montreal Diphtheria Control

The results obtained in Montreal a city with a total population in 1935 of 863 000 afford a further example of what may justly be claimed to be the consequence of a sustained co-ordinated campaign against diphtheria begun in 1926 Previous diphtheria records dating back to 1906 and for the twenty succeeding years, among a

Clinical Memoranda

Treatment with Progesterone of Eight Cases of Pre-eclampsia

In the issue of the *British Medical Journal* for February 13 1937, a series of cases of pre eclampsia treated with progesterone was recorded by J M Robson and S J Paterson The following is an account of a further eight cases, the results of which are summarized in the appended table All cases were treated in the ante natal wards of Walton Hospital, Liverpool The criteria used in a choice of cases were (1) Raised blood pressure—systolic over 150 mm, diastolic over 90 mm , (2) oedema present in all cases (3) albumin present in urine , (4) urea clearance tests and blood non protein nitrogen within normal limits , (5) in most cases additional toxic symptoms were present

In an attempt to discount the beneficial effect of rest the treatment with progesterone did not begin immediately after admission A varying number of days were allowed to elapse before the treatment was started All patients were on an ordinary diet, with a fluid intake limited to one pint Progesterone was then given in daily 5 mg doses In three of the cases (Nos 2, 5, and 7) after a few days the amount was raised to 10 mg daily The progesterone was very kindly supplied by Messrs Schering (proluton) and Messrs Paine and Byrne (gestone) There were two foetal deaths In Case No 2 the foetal heart stopped during the second stage of labour , the necropsy report stated that death was due to toxaemia In No 4 the patient was discharged on her own responsibility (blood pressure 140/95) and advised to attend the antenatal clinic She never attended, and was admitted to hospital about eight weeks later in labour (blood pressure 170/110) The foetal heart could not be heard on admission

Table showing Results of Treatment (Symptoms are graded + to +++ according to the Presence and Intensity of Oedema Vomiting Headache and Eye Signs)

Summary

1 The results obtained following the administration of progesterone in eight patients suffering from pre eclamptic symptoms are given

2 None of the patients developed fits, but in only three was there an appreciable fall in the blood pressure after treatment

I wish to thank Mr J St George Wilson, under whose supervision the cases were treated and Dr H H McWilliam, medical superintendent of Walton Hospital, for permission to publish them

Intussusception in a Young Woman

The occurrence of Murphy's syndrome, save that the presence of a leucocytosis was not confirmed, seems to make this case worth recording

Case Record

On August 8 1937, a woman about 25 (none of my patients know their age) was admitted to hospital complaining of abdominal pain and vomiting. Ten days previously, over a period of an hour or two she developed a generalized abdominal pain, which was worse around the umbilicus This was followed by nausea and later by vomiting, and then diarrhoea The pain settled in the right iliac fossa, where it had remained constant, accompanied by some pain in the left iliac fossa The diarrhoea and vomiting lasted three days. There was no history of the passage of blood or mucus per rectum or of dysentery, but she had had ascaris infection as a child and threadworms three years ago

On examination the patient was thin and her face drawn and anxious, and she was grunting with her respirations A swelling was visible in the right iliac fossa On palpation this was found to be tender, somewhat mobile, firm, and the size of a large orange On vaginal and rectal examination no tenderness was observed, the pelvic contents appeared normal, and there was no blood on the examining finger The temperature was 102° and the pulse 100 Skin sensation was not tested

On August 9 the tumour was higher the lower pole being just below McBurney's point. The temperature was 101, though it had been down to 99°

Laparotomy performed under a spinal anaesthetic revealed an ileo-caecal intussusception with part of the great omentum drawn in There were some adhesions, these were broken down with the finger and the intussusception reduced The appendix, which had been included in the intussusception, appeared perfectly normal No obvious cause was found The caecum was stitched to the abdominal wall and the wound closed There was an uneventful recovery

Commentary

The differential diagnosis at first presented a problem There was a definite appendicitis syndrome of generalized abdominal pain, nausea, vomiting, pain in the right inguinal fossa, and diarrhoea Examination revealed a lump which might have been an abscess In none of the literature at my disposal in this medical outpost is it suggested that intussusception would arise in the differential diagnosis of appendicitis, and possibly this syndrome has not before been observed in intussusception Perhaps a blood count would have helped

The extreme rarity of appendicitis among the natives was a factor against the diagnosis, but the absence of bowel history save for three days' diarrhoea with no passage of blood and mucus, was against intussusception, though the mobility of the tumour was in its favour The absence of dysentery in the history ruled out dysenteric typhlitis The upward shifting of the tumour the following day was strongly in favour of the diagnosis of intussusception

Collision of Twins

The following case may be of interest because of the rarity of the condition

Case Report

Mrs D a primipara of 33 was first seen at the ante natal clinic on February 26, 1937, the calculated date of confinement was April 15 The patient's history, general examination pelvimetry, etc, revealed no abnormality Abdominal palpation however, showed that the uterus was far larger than it should be for the stage of pregnancy A radiograph was ordered, to confirm the suspicion of twins, but the patient neglected to report at the x ray department and also failed to attend the ante-natal department until April 9 Two days later labour started, and she was admitted to hospital.

Examination at the onset of labour revealed twins, one presenting by the breech, the other by the vertex. Labour was normal except for premature rupture of the membranes, and the first child presented at the vulva as a footling right sacro anterior Delivery progressed normally until the infant was extruded as far as the umbilicus, but delay then occurred Vaginal examination showed the arms in the normal position, these were brought down and light traction exerted on the legs and pelvis, but the child could not be delivered, and it became evident that there was some serious obstruction Pulsation of the cord now ceased

It was thought that the twins might have locked, and I was called in to see the patient The first twin was born as far as the lower part of the chest, and both hands were delivered, the back being to the right Abdominally there was one head palpable in the right iliac fossa and a second child lying in the left occipito anterior position, the head of this twin being at a considerably lower level and engaging in the pelvic brim. The heart sounds of this second child were good Under anaesthesia the hand was passed into the vagina and the above findings confirmed The neck of the first twin was considerably elongated, and the head of the second twin was well engaged in the pelvic brim but had not yet descended into the pelvic cavity After several attempts it was found possible to push the head of the second twin—that is the lower head—up out of the pelvis An assistant aided this manœuvre by external manipulation of the breech and body of the second twin through the abdominal wall This was found to be of great assistance in moving the head of the second twin out of the pelvis. Traction was then made on the legs of the first twin and this was easily delivered The lie of the second twin was now corrected to a vertex by external version As the patient recovered from the anaesthetic pains came on and the second twin advanced easily Low forceps were applied to shorten labour This second twin was alive it weighed 5 lb 1 oz. and subsequently did well The third stage was normal The twins were identical uniovular males.

The puerperium was normal except that involution was rather slower than usual there being two small fibroids in the uterine wall

I would like to express my thanks to Dr W D Sturrock, physician in charge of the department, for permission to publish this case.

J H Spence M B, M M S.A,
Assistant Medical Officer Maternity Department
Radcliffe Infirmary, Oxford

population rising from 415 000 to 657 000 had yielded annual averages for each of the seven year periods of, respectively 643 cases and 112 deaths 1,254 cases and 176 deaths and 1 137 cases and 146 deaths reaching in 1927, 1 826 cases and 219 deaths

In 1928, when immunization was started there were 1 632 cases and 157 deaths Thereafter with each succeeding year's increase in the numbers immunized there has followed a steady decline in the diphtheria incidence and mortality, and as the result of a particularly strenuous campaign in 1933 when over 47 000 children were treated by the end of 1935 a total of nearly 116 500, or well over 50 per cent of the child population under 12 years, had been protected As the accompanying Graph II demonstrates, the fall since 1928 has been remarkable, the records in 1935 with 183 cases and twenty one deaths being but a tenth of the figures in 1927 whilst in 1936 only eighteen deaths from diphtheria were recorded in Montreal's population of 863 000 But, to maintain the low incidence and mortality to which diphtheria has fallen in New York and Montreal the further success of immunization must be dependent on the respective campaigns being continuous and unremitting in order to keep up a protection rate at least equal to half the number of births each year

The Position in the British Isles

If such can be achieved in New York and Montreal, why should it be beyond achievement in London and elsewhere in Great Britain? Why should London with a population three millions less show six to seven times as many diphtheria cases and deaths as New York? Surely we should not be resigned to a fatalistic view that co ordination and enterprise of the medical profession, and the necessary education of the general public cannot overcome apathy and indifference and bring about effective control of diphtheria by means of immunization, directed mainly to the protection of children under 5 years of age It is encouraging to know that, thanks to Dr Thomson's efforts immunization has now become available in Belfast (Commencing October 1 1936 he reports that approximately 5 000 have been immunized in the course of the first year's work)

The accompanying table provides a list of the fifty towns with their populations in 1930 and 1936 and the number of diphtheria cases and deaths in that seven year period as well as of those immunized up to the end of 1930 and 1935 and during 1936 The figures given under Immunized indicate the total of those who have received a complete course of prophylactic inoculation irrespective of post Schick testing and do not include either those found Schick negative on primary test—that is the naturally immune—or the immunized adults of hospital staffs In a parallel column is given for each town the approximate immunized percentage of the total population

For comparison similar particulars of three cities in Scotland (Edinburgh Dundee and Aberdeen) with Aberdeen County and three cities in Ireland (Dublin Belfast and Cork) have been appended to the list Of these Cork it will be noted presents the highest protection rate of all—15 per cent—with about 12 000 immunized in a population of over 80 000 of all ages and as the work has largely been devoted to the treatment of children under 15 years, the proportion of child population protected has reached over 50 per cent The desired continuance of the fall in diphtheria incidence and mortality recorded in Cork city in 1935 and 1936 will depend on that proportion of the immunized being maintained and increased year by year

The details of the table attached have been derived either from annual reports of the years concerned or from information kindly supplied recently as well as in years past by many medical officers of health to all of whom grateful acknowledgement is due for their ready help It remains to point out that the London County Council is in no way responsible for any of the observations made or opinions and conclusions expressed in the course of this paper I have also to thank Mr E S Glass for his skilful drawing of the graphs.

SEX-LINKED MICROPHTHALMIA SOMETIMES ASSOCIATED WITH MENTAL DEFICIENCY

BY

J A FRASER ROBERTS, M A , M B , D Sc , F.R.S Ed.

Principal Investigator to the Burden Mental Research Trust Stoke Park Colony Bristol

In 1935 two blind and mentally defective brothers were admitted to Stoke Park Colony The family history then supplied was strongly suggestive of recessive sex linked inheritance This was confirmed when a fuller history was obtained A search of the literature soon revealed the fact that this particular family had been previously described by Ash (1922) Since 1922 however several more children have been born, and it also proved possible to extend the pedigree

It seems desirable for several reasons to give some further account of this family In the first place although Ash stated that the condition was *microphthalmia* he did not describe the appearance of the eyes Further he obtained his information from one family, DII 10–18 in the pedigree, and saw only three blind individuals (DII 10 11 14) who were then young Therefore although it was noted that DII 10 was an epileptic it was hardly possible for Ash to discover from the persons he saw that the eye defect in this family group was sometimes associated with varying degrees of mental deficiency As far as I can discover this is the only certain example of sex linked microphthalmia that has been described so on that account, and because of the remarkable variability in the effects of the genetic factor the family merits a fuller description

The Inheritance of the Defect

The defect is clearly due to a recessive sex linked factor and the pedigree shows no anomaly of any kind There is no suggestion that any male who receives the factor is not born blind and certainly none that the heterozygous females are not entirely normal The defect has appeared in four generations and there is some evidence that it can be traced for six for I 7 informed me that her mother often told her that her (the mother's) grandmother certainly had one and possibly two blind boys The six generations would cover a period of about 200 years

Reviews

MEDICINE IN RUSSIA

Russian Medicine. By W Horsley Gantt (Pp 214 12 illustrations. 2.50 dollars net.) New York Paul B Hoeber Inc. London Harper and Bros (Medical Book Department) 1937

The latest addition to the series of small books on the history of medicine in different countries bearing the general title *Clio Medica* deals with Russia, and some of the matter incorporated in it appeared in our columns in 1924–7 and in 1936 as a Medical Review of Soviet Russia Dr Gantt has three important qualifications for his task, (1) first-hand experience of the country and knowledge of its language, (2) impartiality which is not the impartiality of ignorance, (3) a vivacious style It is true that literary purists may take exception to some of the phrasing and that academic historians may think that the account of Russian conditions before the war of 1914–18 is scrappy and disjointed But English literary critics have no particular claim to dictate to American writers and a well balanced history of a thousand years is not easily compressed into 163 small pages

It is quite safe to say that most ordinarily educated people in England know practically nothing of Russian history down to the war A few anecdotes of Peter the Great and of other dramatically striking figures the campaign of 1812 and the Crimean war are about all the items we have in our memories Of names famous in medical or scientific history before Metchnikoff and Pavlov Pirogov, Mendeleev and v Baer are remembered by most of us and Chebysheff by those who are statisticians but few others In our own time Metchnikoff Pavlov, and Tchouprov are among the very great names of scientific history The vague general impression most of us have is probably this that Russia was populated by large numbers of peasants culturally barbarous ruled despotically by chieftains themselves cruel barbarians with a veneer of foreign polish, and that the cities of St Petersburg and Moscow were frequently the scenes of events which make life in Rome under Tiberius as described by Tacitus seem as sane and humdrum as Trollope's Barchester Dr Gantt's story of the remoter past rather confirms this general impression—indeed provides some picturesque details When we are horrified as we must be by events of our own time in Russia it is proper to remember that no horror of modern times is without a parallel in the past The great famine of 1920–1 (the story of which is illustrated by a photograph so revolting that it should have been omitted from a book intended for general reading) was the worst in history but in 1891–2 thirty five million people are said to have starved and in 1911 one third of the population of European Russia were famished

Dr Gantt's account of the recent history of medicine is interesting He has no doubt that in 1935 the position of scientific men and the conditions under which they worked were much improved although he is very far from suggesting that Russia is a paradise for men of science or medical practitioners He is however sure that no reversion to a pre war organization is possible The question is no longer Will the Soviet Government succeed in its experiment? but What will be the effects on the coming generation of this new order of life?

CLINICAL DIAGNOSIS

Grundriss der Klinischen Diagnostik By Hans Horsters (Pp 615 127 figures 4 coloured plates RM 12 geb RM 13 60) Berlin and Vienna Urban and Schwarzenberg 1936

The foundation of the art of medicine is diagnosis, but the principles of medical diagnosis may be set out in various ways Indeed, each teacher may present the subject-matter in his own way and require his students to follow a set method Professor Horsters of the University of Berlin has brought together the outlines of clinical diagnosis in a new book, in which the emphasis is on the broad principles rather than detailed chemical and technical methods Following the revival of interest in the due consideration and allowance for the constitutional make up of the patient, the author throughout lays stress on the clinical type He recognizes three main types—the narrow-thin the muscular, and the round-fat—but does not develop further the proneness of one type more than another to special diseases Indeed, an abnormal constitution is not necessarily equivalent to a diseased constitution Certain diseases however, are hereditary, and the inheritance of blood groups appears to follow biological laws The author then proceeds to set out and discuss the information that may be gathered by careful clinical examination of the patient as a whole and of the individual organs, using the ordinary methods of inspection, palpation percussion and auscultation There are then twenty pages on general x-ray examination and forty more on the general chemical physical and morphological methods of examining blood and urine The remainder of the book gives in detail the ways of examination and diagnosis in diseases of the various organs There are good discussions of differential diagnosis with tables for rapid revision This part is very completely done in quite a small compass and includes some notes on mental diseases and on poisons, including war gases There is a good index and the few illustrations in the text are helpful The book is handy and the information given is accurate and as full as can be in a small volume

SEROLOGICAL DIAGNOSIS OF SYPHILIS

The Laboratory Diagnosis of Syphilis The Theory Technic and Clinical Interpretation of the Wassermann and Flocculation Tests with Serum and Spinal Fluid By Harry Eagle M D Foreword by J Earle Moore M D (Pp 440 27 figures. 21s net.) London Henry Kimpton 1937

The syphilologist depends so much on the serologist that it is the duty of the latter to make his tests as sensitive and specific as possible Unfortunately in only too many laboratories methods are employed which are out of date and insensitive it is to be hoped therefore that *The Laboratory Diagnosis of Syphilis* by Harry Eagle, will be widely read and there can be few serologists who will not learn a great deal by a careful perusal of its contents

The first part of this book is devoted to the theoretical side of the Wassermann reaction including the nature and properties of complement, antigen and reagin (a better name than Wassermann substance or antibody though a good deal of evidence is adduced to show that it is antibody in the true sense of the word) There follow accounts of the author's own reaction of the Kolmer technique and of a method of using a human cell haemolytic system Part II deals with flocculation tests and their mechanism It is argued that reagin is a protein and that flocculation depends on the deposition of reagin

Description of the Eyes

Six blind males from three different families have been personally examined They are DII 21, 22, DIII 1, DII 10, 11, 14 These are all that could be traced of those still alive, the remaining eight blind males shown in the pedigree being now dead

DII 21 AGED 17 YEARS

Both eyes sunken in sockets, cornea normal in diameter Intraocular tension minus Nystagmus not observed

Right Eye—Cornea shows dense leucoma adherens—no vascularity Anterior chamber shallow Pupil drawn up and very small Lens not seen

Left Eye—Opaque cornea (ground glass appearance) with vessels from ciliary zone Iris adherent to cornea

DII 22 AGED 6 YEARS 7 MONTHS

Both eyes slightly sunken in sockets, cornea normal in diameter Intraocular pressure minus Nystagmus

Right Eye—Cornea clear anterior chamber normal, pupil moderately dilated Iris blackish brown and tremulous Lens light yellow, soft in appearance and dislocated downwards and outwards Fringes of iris pigment adherent to lens.

Left Eye—Cornea shows leucomata Newly formed vessels are to be seen running from iris down and out over the lens capsule Anterior chamber rather shallow Fully dilated pupil Lens subluxated forwards—greyish and soft in appearance

DIII 1 AGED 4 YEARS 10 MONTHS

Both eyes sunken in sockets Cornea of normal size and entirely clear Curvature accentuated, giving deep anterior chamber Iris bluish grey with a rather dull, structureless and homogeneous appearance Intraocular tension minus Rapid, rather coarse nystagmus on turning eyes to either side

Right Eye—Pupil fixed about 3 mm in diameter with slightly irregular margin Lens shows streaky white opacities

Left Eye—Pupil smaller than in right eye about 2 mm in diameter Lens completely opaque and whitish grey

DII 10 AGED 29 YEARS

Both eyes much sunken in sockets Intraocular tension minus Nystagmus similar to DIII 1

Right Eye—Cornea normal in size, white opaque patches all over Lens not seen

Left Eye—Cornea small white patches all over Narrow fringe of iris Pupil about 8 mm in diameter with ragged edge Lens yellowish white and soft in appearance

DII 11 AGED 26 YEARS

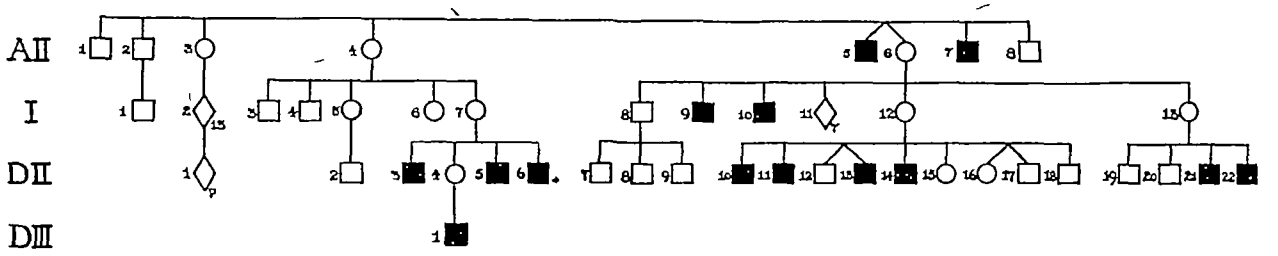
Both eyes much sunken with everted lower lids Both corneae small Intraocular tension minus Nystagmus similar to DIII 1

Right Eye—Cornea shows white patches Lens not seen

Left Eye—Cornea completely opaque ground glass appearance Very similar to left eye of DII 21 Lens not seen

DII 14 AGED 21 YEARS

Both eyes somewhat sunken in sockets Intraocular tension minus Nystagmus similar to DIII 1



Right Eye—Cornea normal in size Dense white patches render it almost completely opaque Lens not seen

Left Eye—Cornea smaller than normal Opacities, especially a dense central patch but cornea not as opaque as in right eye Pupil about 3 mm in diameter, with slightly irregular margin Lens opaque and yellowish white

The mothers of all these boys were seen All stated that the abnormality could be detected immediately after birth In the case of the five in which there are corneal opacities both mothers stated definitely that the whitish appearance of the front of the eye was present at birth, and that, as far as they knew, there had been no change in the appearance of the eyes since that time

The Nature of the Eye Condition

Waardenburg (1932) quotes van Duyse, who, in the French *Encyclopaedia of Teratology (Ophthalmological)* divides microphthalmia into three groups The first is true or simple microphthalmia, the second is microphthalmia associated with coloboma, *the third is microphthalmia* without coloboma but associated with various other abnormalities, such as opacities of the cornea, aniridia, smallness or absence of the lens, and opacities

Genealogical chart showing the incidence of microphthalmia inherited as a sex linked recessive condition (International symbols)

of the lens This classification seems to be generally accepted

The cases here described fall into the third somewhat heterogeneous group That it should be heterogeneous is perhaps not surprising, for in this family, for example, there are considerable differences not only between affected individuals but also between the eyes of the same individual Smallness at least of the cornea is itself a feature not always present

The Mental Condition

Two of the six patients examined may confidently be said to be of normal mentality These are DII 11 and DIII 1 DII 11, aged 26, is well above average intelligence The little boy, DIII 1, is only 4 years and 10 months, but he, too, is above the average in mentality for a child of his age He talks freely and intelligently and showed much interest in and knowledge of the things around him He correctly repeated songs and recitations that he had memorized and performed gymnastic exercises that would have been remarkably good for an ordinary boy of his age

The elder of the two boys at Stoke Park Colony (DII 21) must be classified as an imbecile He can talk, repeat rhymes, etc, can count his fingers, and is continent, but he needs help in order to dress and to feed himself He shows little understanding of what is said to him, and his speech includes much meaningless repetition His brother (DII 22) is an idiot able to walk but unable to talk or to dress himself He is incontinent, his activities are purposeless, and he is subject to violent outbursts of temper

around the lipoidal particles of the antigen, thereby causing their aggregation An outline of seven representative tests is given, including the Eagle, Hinton, Kahn, Kline, Meinicke, Müller, and lentochol-citochol There follow a discussion on the spinal fluid—in which a preference is shown for the Wassermann reaction as against flocculation tests—other tests for syphilis (for example, the Luetin test), the clinical evaluation of the serological report, and the statistical comparison of serological technique and the method of choice

Dr Eagle is a wholehearted exponent of ice-box as against water-bath (37° C) fixation and of employing a pure, highly fortified antigen He uses two different amounts of patient's serum and a pooled complement from at least five guinea-pigs in a fixed amount (one unit volume of a 1 in 10 dilution) Amboceptor is titrated with each batch of tests and 2½ units are added to 3 per cent sheep cells Fixation takes place in the ice box for four hours and water-bath for half an hour Results are read after thirty minutes For his own flocculation test he employs a highly fortified antigen, shakes as in the Kahn, incubates four to eight hours at 37° C, and finally centrifuges for ten to fifteen minutes

Undoubtedly there will be those who disagree with some of the author's pronouncements Must a technique be bad and "out moded" if water bath fixation only is employed, and does native amboceptor necessarily give rise to insensitive results? There are those who deny this latter, and some workers employ an excess of haemolytic amboceptor to obviate such an event Whether it is unnecessary to titrate complement is a moot point, even if one uses sera from a large number of guinea-pigs, *a priori* that is no guarantee that the pooled complement will have a normal titre, as anyone who has worked in the Tropics knows Not all that is to be found in this book must be taken for "gospel," but Dr Eagle is evidently an expert biochemist, and what he has to tell us is both stimulating and highly instructive There is a representative bibliography

RADIOLOGICAL DIAGNOSIS

Textbook of Diagnostic Roentgenology By Lewis J Friedman M D (Pp 646 638 illustrations 42s) New York and London D Appleton-Century Co Inc 1937

This is a useful textbook for the student of radiology, more particularly for those who are preparing for the examination for a diploma in medical radiology While necessarily brief it is comprehensive, and at the end of each section references are given which will be helpful to the student

The opening chapters deal with electricity, high-voltage apparatus, x-ray tubes, and *x*-ray physics These are useful, though hardly sufficient for the requirements of the student *X*-ray technique is fully considered, and the various radiographic accessories, such as the Potter-Bucky diaphragm, intensifying screens, casettes, etc, are well described An excellent chapter entitled Dark-room Procedures' gives the student all he requires to know regarding the fitting up of a dark room, the design of developing tanks, and details of the various photographic processes involved in making an *x*-ray film

The second part of the book is divided into sections dealing with the various systems of the body The development of the osseous system is well described, and an excellent account is given of the common fractures In the chapter on diseases of bones and joints brief descriptions are given of many rare conditions in addition to the well-recognized ones Further chapters are devoted to the respiratory system, the cardiovascular system, the alimentary tract, the biliary tract, and the genito urinary tract The author enumerates the normal and abnormal conditions met with in the radiographic examination of these systems His descriptions are terse and to the point All that is of importance is mentioned, but one often feels that further details would have been beneficial If, however, the student is guided in his reading by the excellent list of references at the end of each chapter he will not be disappointed

The illustrations, which are numerous, are all in the negative and are uniformly good In addition there are many line drawings A useful index completes a thoroughly practical textbook on diagnostic roentgenology

SURGERY OF THE EAR, AIR PASSAGES, AND NECK

Operative Surgery The Ear Air Passages and Neck By Dr Martin Kirschner with the collaboration of A Lautenschlager and Dr O Kleinschmidt Translated by I S Ravdin B S M D and George M Coates, A B, M D Third volume (Pp 528 460 illustrations, mostly coloured 50s net) Philadelphia and London J B Lippincott Co 1937

The third volume of *Operative Surgery*, by Professor Martin Kirschner, contains an account of the surgery of the ear and air passages by Dr Lautenschlager and of the surgery of the neck by Dr Kleinschmidt The American edition is a translation by Dr G M Coates and Dr I S Ravdin, who have also edited the two parts respectively The first part includes the surgery of the ear and its complications, operations on the nose and accessory sinuses including also the lachrymal apparatus and transnasal pituitary operations, also minor and endoscopic operations on the pharynx and larynx, and ends with a chapter on tracheobronchoscopy The second part, by Dr Kleinschmidt, and entitled 'Operations on the Oesophagus and on the Neck," includes oesophagoscopy, numerous external operations on the neck including those for torticollis and cervical ribs, operations on the blood vessels and nerves of the neck, the various types of pharyngotomy, external operations on the larynx including laryngotomy and various methods of laryngectomy, tracheotomy, and a chapter on operations on the thyroid and thymus There is finally a chapter of general interest on tumours of the neck The scope of the book is thus unusual, and it is written rather from the point of view of the general surgeon than from that of the ear specialist or the throat specialist, though the first half is inclined to follow the conventional lines of specialism in otology and laryngology, and the second half inclines more to the recognized domain of general surgery

It will be seen that anyone contemplating interventions in these parts, intracranial operations excluded, will find instructions and directions including liberal illustration of anatomical and surgical details The methods described, however, are German, and some of them would now be regarded as obsolete in Great Britain As examples may be given the bridge operation of Killian on the frontal sinus, suspension laryngoscopy, and high tracheotomy, all described in detail It is difficult to imagine that anyone would now undertake the operation of lateral pharyngotomy by the method of Kronlein, also described in full detail and apparently recommended This disinclination to discard the classical and conventional, possibly even to cling to them, is seen in numerous instances throughout the book, a striking one being the adherence to proximal instead of distal illumination in endoscopy The American editors, however, have not failed to intervene parenthetic-

DII 10, aged 29 is an imbecile, though not of as low a grade as DII 21 He walks and talks but for the most part sits silent From time to time however, he is able to express himself coherently when a subject is mentioned that interests him He can dress and feed but not shave himself At the age of 7 following an attack of measles he had epileptic fits which continued till he was 17 After a period of remission lasting four years the fits recommenced and now occur about once a week

The third surviving blind boy in this family (DII 14) must be classified as feebleminded He went to the Blind School and learnt to read and copy braille He copies very slowly however His mentality appears to be of about a 10 year level He is docile and cheerful and can look after himself generally dressing washing, and feeding but not shaving himself One of his great pleasures is the constant repetition of stories by his elder blind brother about such things as events at the Blind School Thus of the six males personally examined two are of normal mentality one is feebleminded, two are imbeciles, and one is an idiot

It is possible from the very clear information given by their relatives to make some estimate of the mentality of a few of the other affected males who are now dead The mother of the three boys DII 3 5 6 stated that the eldest, who died at the age of 5 could talk and play the piano So far as she could tell he was quite normal mentally He died following an epileptic fit, his first The second boy was an idiot who was unable to talk or even to walk unassisted He commenced to have epileptic fits for the first time at the age of 16, and died at the age of 18 following fits The third boy apparently exhibited the most extreme degree of idiocy in the whole series He was unable to walk or talk and could not even stand He was fed by means of a bottle till his death at the age of 14 He did not have any fits The fourth blind male (DII 13) in family DII 10–18 died at the age of 1 year and 5 months so no statement can be made regarding his mentality

As regards the earlier generations the only information available is that AII 5 who died at the age of 47 was mentally defective This was definitely stated to be so by his nieces

Notes on Other Persons shown in the Pedigree Chart

AII 3—The rest of the family have now lost touch with AII 3 but state that she had thirteen children all normal and that her daughters have several sons also all normal

AII 7—Died aged 9 years. Blind Mental state unknown

Sibship I 8-13—*Birth order and sex of some individuals uncertain though it seems fairly certain that the total number was 12, including two blind males.* Several other children died in infancy before the birth of my informants, I 12 and I 13 who were themselves the youngest in the family I 9 and I 10 were both blind and died young before the birth of I 12 and I 13

DII 16—Died aged 1 month. Eyes normal.

DII 17—Died aged 6 months. Eyes normal.

Discussion

Inherited microphthalmia is a rare condition but in regard to microphthalmia inherited as a sex linked recessive this family group appears to be the only undoubted case yet described Waardenburg (1932) in his invaluable book on hereditary diseases of the eye considers it possible that this type of inheritance may have some times been overlooked but quotes Ash's pedigree as the only clear example I am not aware of any other published since 1932 Apart from his however, there are several features to be noted In the first place the appearance of the eyes varies very considerably in different persons and the two eyes in a single individual may be strikingly different A somewhat heterogeneous group of maldeveloped eyes has usually been accepted as forming an entity and there would seem to be at least a genetical justification for this course Another point is that the appearance of the cornea in some cases could easily be mistaken for the end result of an ordinary inflammatory process yet the condition is strictly an inherited one the cornea is apparently opaque at birth and there is no suggestion of post natal inflammation a point about which I was careful to inquire The condition therefore would seem to be yet another example of an abiotrophy closely simulating the end results of an infective process

Perhaps the most remarkable feature is the association with mental deficiency The blindness is compatible with normal mentality as in two of the cases personally examined but in other instances there may be any grade of mental deficiency ranging from feeblemindedness to the most extreme idiocy There is no suggestion of any mental deficiency in the family apart from the blindness The numerous normal members that I have seen are entirely normal and would as a group have to be classed as of above average intelligence Nor could any history be obtained of mental deficiency apart from blindness in those members of the family that I did not see The persons who provided the information were unusually objective in their statements and had formed an accurate estimate of the mentality of the blind males had any persons not blind been mentally defective I am sure that the fact would have been appreciated and that I should have been informed

It has been noted by several writers that microphthalmia may be associated with mental impairment For example Ramsey (1898) states that it is occasionally related to defective mental development and Parsons (1904) states that there is sometimes an association with brain malformations and idiocy Kubik (1923) described a 12 day rabbit embryo with complete bilateral anophthalmia and aplasia of the forebrain and midbrain The father of this rabbit had microphthalmia with coloboma Kubik considers that the condition ranges from the slightest colobomata through microphthalmia cyclopia, and anophthalmia to cases in which there is more or less extensive aplasia of the sections of the brain from which the eye is developed In papers dealing with hereditary microphthalmia in man however there is seldom any reference to impaired mental development Usher (1921) described a family group containing eleven affected persons and stated that one of these was mentally affected and died in an asylum but such instances would seem to be rare

In the case of the family described in this paper it is impossible to say in the absence of the examination of a brain whether the mental deficiency when present is due to specific malformations of the type described by Kubik or whether the entire brain would show the underdevelopment and maldevelopment that is so characteristic of the brains of ordinary mental defectives The blind and mentally defective persons do not show any abnormal neurological signs of note and apart from the blindness would fall into the large group of mental defectives of no particular type so it is perhaps unlikely that the mental impairment is due to cerebral aplasia of a limited and special kind

The genetic factor in this family group produces very diverse effects and is constant only in producing blindness

ally on numerous occasions when the German colleague is thought to require correction or shows some lack of emphasis This is especially the case in the part devoted to operations on the thyroid gland The editor has here offered so many interpolations that the page rather suggests the paper of a candidate after handling by a critical examiner than part of a textbook and if the account is worth anything which it certainly is the author might have been left to tell his tale with less interference, however vast and exceptional the experience of the editor may have been The translation on the whole is well done though occasionally sentences are encountered which have been so rendered that they are devoid of any intelligible significance

The book will be of value and help chiefly to a surgeon who contemplates one of the less common but classical and recognized operations on the neck for he will find it well described and beautifully illustrated

A HAEMATOLOGICAL ATLAS

Atlas of Haematology By Edwin E Osgood M A M D and Clarence M Ashworth (Pp 255 325 illustrations frontispiece in colour 45s net) San Francisco J W Stacey Inc 1937

The great attraction of this haematological atlas is the beautiful collection of over 300 coloured photo-engravings of stained cells from the blood and bone marrow of various cases normal and pathologic at a magnification of 2 500 This permits reproduction of quite minute differences of detail, yet even at this we find it is not invariably easy to decide if the structure of one cell nucleus is more or less finely or coarsely granular than another Unfortunately the authors have introduced a most disturbing nomenclature However old-fashioned it may be, we all know what we mean by a polymorph and to call it a "lobocyte is laughable All the red cell series are given fresh names even the non nucleated and mature red cell appears as an akaryocyte —followed by non-nucleated erythrocyte in parentheses Basophilic normoblast becomes prokaryocyte Then again the "mast cell, an old well understood term means nothing as progranulocyte S and there are other changes equally distracting to peaceful reading

The book is said to be written for clinicians technicians and students. It is of course agreeable to have such a collection of illustrations but owing to the unavoidable weight and consequent expense of the volume, and the complicated arrangement of the letterpress, it will be more useful to the leisurely researching haematologist than to the busy clinician and is certainly not a book for students The publishers are much to be congratulated on their extremely beautiful reproductions

Notes on Books

Bushveld Doctor by Mr C Louis Leipoldt F R C S (Jonathan Cape 10s 6d) is a most interesting but modestly written account of the Bushveld and an achievement in preventive medicine in the Transvaal The author born in South Africa but medically educated in Europe was while an assistant medical inspector of schools in London under Dr James Kerr appointed medical inspector of schools in the Transvaal It was by first appointment of the kind and no arrangements about its duties had been made individual examination of children and the help of a trained nurse had not been contemplated On arrival he found that if he stopped a boy at school he could be convicted of *crimen injuria* a particularly comprehensive term which might connote anything from exhibitionism to indecent assault The general opinion was that children in the Transvaal were extremely healthy but his inspections, which entailed an enormous amount of difficult travelling revealed an appalling state of disease among the children especially from malaria, "the curse of the Bushveld, and bilharziasis The author's graphically told experiences include an account of the old President, Paul Kruger, whom he saw in his last days in Holland and of whom as a Bushveld man he gives a very pleasant picture quite different from that generally drawn Another and most impressive chapter is that on "the right to die and euthanasia

Mrs C F Lyel's *Herbal Delights* (Faber and Faber 15s) is a pretty book within and without, and it would make a charming present for the kind of friend who likes to know about tisanes, syrups, confections electuaries juleps vinegars and conserves and can enjoy the drawings of herbs by Miss Rivers Moore There is nothing in this volume that need offend those of us who frown upon the activities of the author in the field of medical herbalism

In *99 Wimpole Street* (Chapman and Hall, 5s) Mr J Johnston Abraham the master craftsman of *The Surgeon's Log* has collected into book form a number of essays the majority of which reflect on life as seen through the doctor's window In one of these he deplores the inaccuracies of the modern novelist in medical matters For example in an otherwise admirable book one of the chief characters while still a house surgeon, already possessed a European reputation because he had discovered the bacillus of amoebic dysentery In another, Mainly About Grooves he deprecates the monotony of outlook in this modern age of mass production Pitying the occupants of the worst groove of all those with no real interest in life and no settled occupation he recalls Sir Andrew Clark's prescription for duchesses—to eat mushrooms for breakfast that they had collected themselves at six o'clock in the morning Other essays deal with the cruising habit the modern composition of Harley Street and various aspects of medicine The best of all, Why Women Dress is a fine piece of penetrative analysis There have perhaps been too many books of this type by medical authors in recent years but Mr Abraham's remarkable powers of observation and proved literary ability justify him in adding to their number This is a good bedside book

Observation by cinematograph studies and detailed records of babies and their food has enabled Professor A Gesel and Dr F L Ilg to discuss in *Feeding Behaviour of Infants* (J B Lippincott Co 21s) the exact way in which the normal healthy baby behaves when more or less left alone to determine his own feeding habits It is clear that although certain general rules and regulations must be established in regard to infant feeding —and the infants studied developed in general conformity with such laws—each baby has an individual mode of interpretation It follows that the greatest success in the management of infant feeding will be secured when wide individual variations are allowed For example weaning from a bottle to cup may occur at ages varying from 64 weeks to 100 weeks Attempts to push on with weaning before the child is willing to co operate may result in disturbances of behaviour This volume will be of great interest to students of child psychology It is well documented and profusely illustrated mainly from the cinematograph studies mentioned above

Dr James Alexander Wilson has now published Volume II of *A Contribution to the History of Lanarkshire* It contains over ninety illustrations and lists of pre Reformation clergy Volume I was published in November 1936 The price of each is 21s., and the publishers are J Wylie and Co, 27, Gordon Street Glasgow, C 1

of microphthalmic type It is unprofitable to speculate as to the additional influences that determine such big differences in the mentality of affected persons They are perhaps unlikely to be genetic, in view of the wide range of the effects and in view of the occurrence of very different mentalities in affected persons in the same sibship It may be more reasonable to conclude that the organism during critical stages of its development is for genetic reasons abnormally sensitive to non genetic influences and that these, entirely trivial in the case of normal persons, are on occasion capable of modifying the development of the brain and so of profoundly affecting its ultimate structure

Summary

1 A family group is described in which microphthalmia is inherited as a sex-linked recessive condition

2 The appearance of the eyes in six affected persons shows much variation

3 The blind males may be of normal mentality or may exhibit any grade of mental deficiency from feeblemindedness to profound idiocy There is no mental deficiency in the family group apart from the blindness

I am greatly indebted to Mr A E. Iles, consulting ophthalmologist to Stoke Park Colony, for the description given above of the eyes of the two patients at that institution (DII 21 22) and for his advice on the examination of the other blind persons and on the preparation of this paper

MODERN CONTROL OF SCARLET FEVER*

BY

W R F COLLIS, M D., F R C P, F R C.P I., D P H.

Physician to the National Children's Hospital Paediatrician to the Rotunda Hospital Dublin

This paper is written with a view to elucidating some of the problems with which the clinician is confronted when dealing with scarlet fever and haemolytic streptococcal pharyngitis It is now generally accepted that scarlet fever occurs through certain types of *Streptococcus pyogenes* multiplying in the body and giving off an exotoxin which on gaining admission to the circulation causes the skin capillaries to dilate, the characteristic rash resulting This toxin is neutralizable by its specific antitoxin

Whilst working with Dr F Griffith some years ago I took thirteen strains of haemolytic streptococci obtained in epidemics of scarlet fever and pharyngitis from different parts of England, and tested their toxigenic power on patients with known skin reactions to standard Dick toxin We found that the amount of toxin produced by the different strains was very variable, some filtrates giving a positive reaction when 0 1 c cm of a 1 in 4,000 solution was injected intradermally, others almost none when 0 1 c cm of a 1 in 50 solution was similarly used When we correlated these findings with the type of epidemic from which the strains had been cultured we found that

1 In the epidemics caused by the powerful toxigenic strains were many cases of clinical scarlet fever and a few cases of simple pharyngitis

2 Where medium toxigenic strains were the cause the number of cases of clinical scarlet fever and of pharyngitis were about equal.

3 Where a low toxigenic strain was the cause no clinical scarlet fever cases or only an occasional one appeared among many cases of pharyngitis

It was clear that erythema, one important element of the clinical syndrome of scarlet fever, may be absent in cases of scarlatinal infection—that is to say, given an acute infection with haemolytic streptococcus a severe or transient erythema may develop or none at all The conclusion that may be drawn from these observations is that scarlet fever cannot be considered as a specific disease like plague or cholera it is one of the protean manifestations of streptococcal infection

Further studies of the immunology of the haemolytic streptococcus show that the exotoxin is only one of its weapons of offence, among others being its lytic and invasive powers Hence clinically acute pharyngitis caused by a haemolytic streptococcus can occur, without resulting rash, if (1) the patient has sufficient antitoxin to neutralize the toxin produced by the invading streptococcus, (2) the organism has little or no toxigenic power For these reasons the term scarlet fever, which was introduced before the aetiology of the disease was known, may be misleading At present tonsillitis with erythema is called scarlet fever, and is a notifiable disease against which the most strict precautions must be taken—for example, hospitalization, isolation, etc—while pharyngitis caused by the same organism but without erythema is regarded as a mild complaint for which no special measures are necessary This attitude has caused the clinician much trouble in the past, particularly when dealing with epidemics of scarlet fever or pharyngitis in the wards of children's hospitals or in semi isolated communities such as schools

It has been found that the isolation of cases of clinical scarlet fever for six weeks does not stop the spread of the disease Public health notification and hospitalization have not reduced the morbidity during the past twenty five years In several well known schools outbreaks of scarlet fever have occurred term after term for over a year, often followed by severe complications, although the doctors in charge employed all the usual methods of control laid down in the textbooks The best example is given by Glover and Griffith (1930), who described an outbreak of 'scarlet fever" in a school of fifty boys which continued for three terms They show how all the cases were caused by the same organism, the fresh outbreaks being brought about by patients whose throats still carried the germ when released after the usual isolation period

Recently I have had the opportunity of testing clinically the validity of the above experiments and observations in an epidemic which occurred in a Dublin public school

TABLE I—*Showing Time of Occurrence of Eleven Cases of Pharyngitis at a Public School*

Preparations and Appliances

IMPROVED EAR SYRINGE AND TROUGH

Dr B RICHARDSON BILLINGS (Petts Wood) writes

I should like to bring to the notice of all those who occasionally have to syringe out ears a modification of mine, which has been ably carried out by the Holborn Surgical Instrument Co, Ltd of 26 Thavies Inn London E C 1 By introducing between the syringe barrel and its nozzle an adaptor with a two valve one way system the formerly slow and laborious refilling of the syringe for each charge is rendered unnecessary A spring on the piston rod facilitates suction While the filling of the syringe is rapid and easy the force and direction of its discharge are still under the control of the

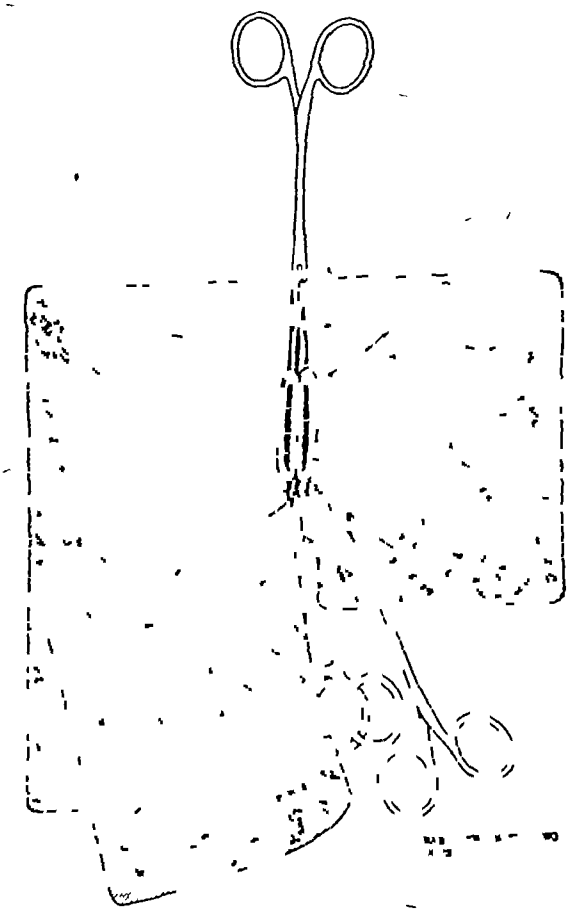
operator An additional refinement is an ear trough which fits well under the ear and has a handle for the patient to hold Down this handle runs a waste pipe connected to a rubber tube which empties into a convenient receptacle The top end of this waste pipe projects a little above the floor of the trough, permitting lotion to run away but trapping any cerumen ready for exhibition With these added refinements ear-syringing is converted from a tedious messy performance into a quick cleanly, and easy process satisfactory alike to patient and operator The syringe also has other uses.

"SHIELDS" TO PREVENT CONTAMINATION IN GASTRO INTESTINAL SURGERY

Mr A SIMPSON SMITH M Chir (London, W 1), writes

At the Buckston Browne Research Farm some three years ago the mortality from peritonitis in gastro intestinal anastomoses at my hands was very high Since the introduction of the shields about to be described peritonitis has become an uncommon event and during the past two years the appliances have been used to advantage in human intestinal surgery

The devices are made of rubber, and have folded ends to fit over the outer blades of opposed intestinal clamps, as in the diagram The inner blades are covered with the usual tubing a small portion of which is made to project over the metal ends so that an artery forceps can later hold them together (A) It is convenient to apply the clamp with the small shield to the stomach or bowel further from the operator, and the clamp with the flapped shield to the bowel nearer the operator so that any fixed catgut ends can be readily slipped underneath the flap by the assistant (See diagram) This manœuvre is not essential but it avoids the assistant s hand stretching over to the operator s side and is no more arduous to remember than the application of the right hand component of a Lane s gastrojejunostomy clamp to the stomach The advantages of these shields are



1 Any inadvertent intestinal oozing over the edge of the anastomosis slowly runs down the rubber and can be mopped up long before it has any chance of soiling the peripheral towels. It cannot seep into the peritoneal cavity

2 All instruments are covered up and sewing becomes a pleasure rather than an exercise in avoiding projecting handles

3 The "catching of the length of suture material, or needle or operator s finger on swabs that used to be laid on either side of the anastomotic line is entirely eliminated on the smooth rubber

4 The flap of the shield eliminates the necessity for any "catch" to hold the handles of the clamps together The distal ends are kept in place by an artery forceps placed one jaw up either lumen of the inner rubber tubes (A)

5 If the anastomosis is done under local anaesthesia and the patient coughs coils of small intestine cannot push

through the rubber sheets, or foul themselves by falling across the anastomotic line

6 The shields are of great use in partial gastrectomy, gastrojejunostomy and entero anastomosis but are not intended to usurp the great use of the Rankin and similar clamps in aseptic intestinal or colonic surgery

Messrs Down Bros are the manufacturers of these shields in the sizes necessary for large, medium, and children s alimentary clamps

I am grateful to Sir Arthur Keith and to Professor John Beattie for kind permission to use these shields at the Buckston Browne Research Farm and at the Research Department of the Royal College of Surgeons, and I have to thank Mr Steward of the Royal College for the excellent diagram, and Mr Paske also of the College for preparing the first set of shields

should be stated that a boy who had been "seedy" for some time was admitted to the sanatorium suffering from pharyngitis and cervical adenitis The next day a boy was admitted with a very acute pharyngitis he subsequently developed the typical erythema of scarlet fever On the 3rd and 4th two other boys were admitted with acute pharyngitis one developing erythema the other not Two days later the whole school had their throats swabbed The previous four cases of pharyngitis showed pure growths of haemolytic streptococci and four carriers were discovered Strict isolation followed During the following six days three more cases of pharyngitis appeared one of them developing a rash The school was Dick tested and anti scarlatinal serum was given to all positive cases No further cases of pharyngitis with or without erythema occurred

Technique

In dealing with an epidemic of scarlet fever the problem of sorting out carriers of haemolytic streptococci is always one of considerable difficulty since if a group of people have their throats swabbed a number of the resulting culture plates usually show colonies of haemolytic streptococci The streptococci from the different persons often belong to different types some of which are not of epidemic importance Streptococcal strains can be differentiated to some extent by their cultural appearances and definitely by precipitation and agglutination methods The preparation of the culture plate is of importance if the individual colonies are studied the double layered plate (in which first a layer of plain agar is poured over the plate and allowed to set and then a thin layer of blood agar) being the best Horses blood is better than human blood in the preparation of the blood agar as it does not contain specific antibodies to the haemolytic streptococcus while human blood may

In the epidemic reported here the causal organism had a characteristic appearance on the plates being large and rough and having a wide zone of haemolysis around Other streptococci which were isolated were small and smooth with small zones of haemolysis Dr Griffith typed the dominant strain and found it to be *Streptococcus pyogenes* Type I Altogether eleven of the boys (other than those clinically affected) had some colonies of haemolytic streptococci in their throat cultures but with repeated cultures following the above methods seven were eliminated as non pathogenic leaving four definite carriers of the epidemic strain The latter four are those mentioned above

TABLE II—*Showing the Subsequent History of the Patients*

Case	Type	Weeks Elapsed Before Haemolytic Streptococci Disappeared	Complications	Surgical Treatment
1	Clinical case	8	Left mastoiditis	Ethmoidectomy
2	—	9	—	Tonsillectomy six weeks
3	—	10	Axillary abscess	Incision
4	Carrier	6	—	—
5	—	8	—	Tonsillectomy six weeks
6	—	9	—	Tonsillectomy six weeks
7	—	—	—	Adenoidectomy six weeks
8	Carrier	—	—	—
9	—	3	—	—
10	—	5	—	Tonsillectomy six weeks
11	—	—	—	Tonsillectomy six weeks

The foregoing table shows the subsequent history of the three patients with clinical scarlet fever the four with pharyngitis without rash and the four carriers

The organism was a highly toxic strain All three cases showing erythema were very ill Two of them developed further complications—in one an acute ethmoiditis in the other a severe axillary abscess Their throat cultures were positive for eight nine and ten weeks respectively

The four cases of pharyngitis without rash were not nearly so ill indeed in two of them the temperature did not rise above 100° F but their throat cultures remained positive for six, eight nine and twenty two weeks respectively the last case being that of the boy who had started the epidemic Every form of treatment was tried for this boy gargles throat paints etc adenoidectomy (his tonsils had been removed years previously) open air holiday in the country All failed and he was not allowed to return at the beginning of the following term In the end he cleared up spontaneously In the case of the four carriers the throat cultures were positive for two three five, and six weeks respectively

Local antiseptic treatment appeared to have little or no effect on the throat infection Hence in five cases with persistent cultures associated with enlarged tonsils and adenoids tonsillectomy was performed All these cases cleared up within ten days of the operation It should be noted that the above epidemic occurred before the general acceptance of the specific action of prontosil on haemolytic streptococcal infection It is possible that the whole course of the epidemic might have been shortened by its use and complications and operations avoided

Discussion

It is clear from the above analysis that if an epidemic of scarlet fever is to be stamped out in a community the old method of six weeks isolation or waiting until peeling is complete is altogether inadequate and should be replaced by one of control by throat cultures Also isolation must include not only clinical cases of haemolytic pharyngitis but also carriers of the specific organism In the epidemic reported here it is impossible to say whether the administration of anti scarlatiniform serum had a preventive effect on the development of further cases of pharyngitis It is noticeable that no further cases appeared after its administration but against this we must place the fact that strict isolation of all positive cases was started at the same time In addition the fact that pharyngitis occurred in four cases unassociated with erythema shows that the invasive power of the organism is not checked by the presence of circulating antitoxin in the patient

Conclusion

Whilst the name scarlet fever is an unscientific term which may lead to misunderstanding it has been established by usage and there would be many difficulties in replacing it by the more aetiologically correct title haemolytic streptococcal pharyngitis No opportunity however should be neglected of emphasizing both to members of our profession and to the laity that an acute pharyngitis or tonsillitis may have the same causal agent as typical scarlet fever and may be a focus for the spread of scarlatinal infection In applying modern knowledge on the epidemiology of streptococcal infections the practical problem of supplying a service for streptococcal throat swabs on a large scale will arise and the whole problem

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY DECEMBER 18 1937

A SURVEY OF THE BRITISH HEALTH SERVICES

The report of P E P, which is summarized elsewhere in this issue (p 1235), claims to be the first attempt to show how all the health services in Great Britain—preventive, curative, environmental, and ancillary—work and fit together, what they have achieved, and where their defects and problems lie The claim is justified The annual reports of the Ministry of Health and of its Chief Medical Officer are descriptive of the work for which they are responsible, and from time to time these reports contain surveys of special problems or of periods of endeavour The Registrar-General, in his annual reviews and decennial supplements, traces the measurable course of disease and death From the medical point of view our Association has issued grey books on many aspects of the health service, and in 1930 it brought them together in the Proposals for a General Medical Service for the Nation, a report which is at present under revision Only last year the Committee on Scottish Health Services published the result of its long deliberations on the machinery for maintaining the health of the people of Scotland, covering for that country nearly as wide a field as the report of P E P But this survey is more comprehensive in its range than anything that has yet been done and more frankly, though constructively, critical of the chaos in which the many independent and sometimes conflicting health agencies operate

The report of P E P must not be thought of as a description and evaluation merely of the statutory health services This it does in great detail dealing with central and local authorities areas of local government and problems of environmental hygiene such as housing water supplies atmospheric pollution and the control of infectious diseases, as well as the more modern personal services like the care of mothers and children, school health and the prevention and treatment of tuberculosis and venereal diseases Its examination however extends much further embracing voluntary hospitals the position and functions of the general practitioner the consultant, and the specialist, the influence of occupation on health and the place of the industrial medical officer, problems of research and genetics, nutrition, physical education, and rehabilitation of the disabled The need for experimentation not only in medical and social science but also in the science of administration is emphasized, a plea which seems to justify the British system of delegation of executive responsibility to local authorities, provided these are big enough to reach a reasonable standard of efficiency

The standard of factual accuracy is high It is, however, not the case that "the minimum salary for all but probationers is £600 a year" in the public health service, as the authors aver Apparently they have not seen the memorandum of recommendations in regard to salaries of whole-time public health medical officers (commonly known as the Askwith Memorandum), agreed by conference between representatives of local authorities and the British Medical Association in 1929 and still in force The error is rather an important one, since the context suggests that private practice is financially attractive because there is no great demand for posts in the public health service at the salary mentioned The posts apparently meant carry a commencing salary of £500 per annum for officers with "at least three years' experience in the practice of their profession subsequent to obtaining a registrable qualification," and in effect, though not statutorily, they involve hospital experience and a rather expensive and prolonged period of postgraduate study for a degree or diploma in public health

P E P decides definitely in favour of extensions of medical benefit, as every responsible body exploring the subject in recent years has done Its view is that the cost should be met by insurance The report recommends that insurance committees should be abolished and replaced by county and county borough councils, and the authors would obviously like to find means of getting rid of approved societies, most of which they regard as democratic only in name Extensions should include not only dependants, independent workers earning less than £250 per annum, and dependants of the latter group, but also consultant and specialist services, in the form of advice and treatment at consulting centres, advice at home for those unable to travel, and laboratory provision They do not agree with the majority view of the Royal Commission of 1926 that the consultant and specialist services should be separate and distinct from the out patient departments of the hospitals and local authorities, maintaining that the administrative changes consequent on the Local Government Act, 1929, and the growth of hospital con-

of hospitalization and isolation will need revision It should not be assumed from this that I am in favour of abolishing fever hospital treatment for clinical scarlet fever, but rather that accommodation should be provided also for acute pharyngitis caused by the same organism

I wish to express my thanks to Dr F Griffith for his co-operation in this work and his help and advice in the composition of this paper

VITAMIN E IN THE TREATMENT OF HABITUAL ABORTION*

BY

DAVID CURRIE, Ch M., F R C S , M C O G

Honorary Surgeon Leeds Maternity Hospital

During the past few years the importance of the vitamins in the maintenance of the growing embryo has been repeatedly demonstrated In 1922 Evans and Bishop discovered that rats when given a fairly normal diet failed to reproduce unless certain essential foodstuffs were present, while in all other respects they were normal The females exhibited oestrus and even conceived, but they failed to deliver the young either the foetus died *in utero* and was reabsorbed or the uterus aborted

The Missing Factor

Other observers, working independently, came to similar conclusions The essential missing factor was found in fresh green vegetables—for example, lettuces—but the most abundant yield was obtained from the embryo of seeds, especially the germ of wheat Sure (1924) called this essential factor vitamin E This vitamin is supplied for clinical purposes in wheat-germ oil, and animals deprived of it show definite defects in their ability to reproduce The males suffer irreparable damage to the germinal epithelium of the testes, and whereas the sex glands in the female are unaffected, the vitamin deficiency leads to the death of the foetus, with subsequent abortion or reabsorption (Evans and Burr, 1927)

Vogt-Möller (1933) of Copenhagen first made use of the vitamins as a therapeutic agent in cases of sterility and abortion in domestic animals, and his results were such that he was tempted to apply the method as a means of cure in habitual abortion in women He reported a series of nineteen patients treated with a preparation of wheat-germ oil called "fertilan," sixteen of whom gave birth to living children

If we are correct in assuming that the vitamin has such an important action in aiding the growth of the foetus it is difficult to explain why women taking the varied and sufficient diet of to-day need any addition of an essential accessory food factor It may be that those women who abort possess a personal idiosyncrasy, possibly, in them, the developing embryo demands a greater concentration of the vitamin, or perhaps they are unable to absorb the necessary amount from the normal diet

Treatment with Wheat-germ Oil

It was Vogt-Möller's paper and the offer of wheat-germ oil from Glaxo Laboratories Ltd that encouraged me to treat habitual abortion with vitamin E, and the results obtained show similar satisfying figures to those published by Watson and Tew (1936) and Miles M'Gonigle (1935) Watson in his paper has pointed out that vitamin E bears more resemblance as regards clinical features, physiological properties, and clinical significance to the luteal hormone (progestin) than to other hormones This is a point of interest, because other observers (Johnson, Krohn, and Kane) have achieved satisfactory results in the treatment of habitual abortion with the use of the luteal hormone, and as James Young (1937) has pointed out it may be that the work of the vitamin is completed when the placenta is fully developed Until recently it was the accepted view that the action of the corpus luteum ceased about the middle of pregnancy, and this statement was substantiated by the fact that women did not necessarily abort if the ovaries were removed after the twelfth week We now know that the amount of luteal hormone continues to increase during pregnancy even though the corpus luteum diminishes in size, and it is believed that the hormone is supplied by the placenta during the later months and that a deficiency of it leads to toxic conditions such as albuminuria, eclampsia, and accidental haemorrhage At present I am attempting to cure these conditions by the injection of Schering's proluton

If this hypothesis be true, then vitamin E is only essential during the early months of pregnancy, and by reason of the aid it gives in the formation of the placenta it provides for the supply of luteal hormone in the later months

These latter details were unknown to me three years ago when I began treating cases of habitual abortion with wheat-germ oil, and the majority of the cases here described have had no treatment other than vitamin E, save for the addition of vitamins A and D and calcium which were given to a small number of patients Each case was examined for such accepted causes of abortion as fibroids, retroversion, torn cervix, syphilis, and other general diseases, and on only two occasions was the blood Wassermann reaction found to be positive One capsule containing three minims of the oil extract was given daily from the first attendance until the day of delivery

Results

Over fifty women have been given wheat-germ oil during pregnancy, but since habitual abortion implies that more than one pregnancy has failed to go to term I have included in Table I only those patients who have experienced more than one abortion Having allowed for this we find that thirty seven women who had had collectively 130 pregnancies gave birth to only sixteen viable children Under treatment these women produced thirty-seven living children Two of them aborted, there were two sets of twins, and four children died in hospital from prematurity

The appearance of albuminuria of pregnancy to a severe degree was a new problem that arose during treatment Five patients showed gross signs of toxaemia, in one it was necessary to induce labour by puncture of the membranes, and in two Caesarean section was carried out Similar complications are now being treated by the injection of proluton.

Table I shows the results in detail It will be noticed that in the great majority of cases treatment was not instituted until after the twelfth week of pregnancy—that is, until the placenta was fully formed—and yet the

* Read at a joint meeting of the Sections of Obstetrics and Gynaecology and Nutrition at the Annual Meeting of the British Medical Association Belfast 1937

tributory schemes have made any such arrangement unacceptable The estimated number of dependants is 15 millions, of independent workers (tentatively) 1,030,000, with dependants of these at 850,000 At a capitation fee of 9s extension of the present medical benefit would therefore cost £10,130,000 annually, at 6s, £7,750,000 The fee of 6s is used in the alternative calculation because it was mentioned by the Committee on Scottish Health Services, but it is not accepted as being adequate *P E P* offers no opinion as to the sufficiency of 9s, but it clearly envisages a raising of the standard of service and possibly a limitation of panels, which would open up the whole question of remuneration in insurance practice Specialist and consultant services, on the basis of the Royal Commission's estimate of 2s per insured person in England and Wales and 2s 9d–3s in Scotland, and taking insured persons at 15 millions, together with the 14–16 age group, would cost roughly £2 million, and extensions to dependants and others £1,700,000 Improved dental benefit for both the present and the new beneficiaries would cost more than £4 million A maternity service comparable to that about to be established in Scotland is advocated, and this again should be financed through insurance. Allowing only £1 for cash benefit instead of the present £2, as suggested by the Royal Commission, such a service would involve total maternity costs of £3 5s per woman of insurance status confined and a total new expense not exceeding £700,000 per annum It is assumed in relation to all these extensions, with the possible exception of consultant and specialist benefit, that the cost would be borne equally by the State and the contributors, although some of the surplus funds of approved societies now spent on dental benefit should be utilized to finance a statutory benefit More than £18 million would have to be found and the employees' share would entail additional weekly contributions of 3d per week In the authors' opinion there is strong evidence that workers are able and willing to make such payments, and they deprecate any further burden on the rating system, whoch they regard as obsolete and inequitable They do recognize, however, that the growth of these and other forms of insurance, such as hospital contributory schemes, may lower the standard of life by the weekly drain on income As the majority and minority reports on the Scottish health services showed, these points are highly controversial, but the mode of finance is not one which concerns medical practitioners in their professional capacity, and we shall therefore make no further comment on them It will be noted that the new benefits proposed do not extend to hospital in-patient treatment.

The extension of benefits, however financed, has been for many years a part of the British Medical Association's programme, and it is satisfactory that it should receive this weighty, if anonymous, support The report regards consultant and specialist benefit not only as a direct advantage to the beneficiaries but also as an essential contribution toward an increase of efficiency among the insurance practitioners so brought into contact with consultants The general practitioner is regarded as the pivot of any health service, but collaboration should be carried further by the establishment of clinics at which practitioners and specialists will meet and work together, after the manner of the Dawson and Welsh reports of 1920 P E P does not share the profession's preference for the isolated private consulting room

Space precludes reference here to many of the interesting and important topics dealt with in this report There is little to be cavilled at and much that has the unqualified support of our Association The authors confess that they are far from satisfied with their survey, and that its purpose will have been served if it induces those who are concerned with the British health services to look at them in relation to the national life and less as a mass of separate experience It is likely that this object will be attained The Secretary of the B M A has issued a statement to the newspapers welcoming the report and commending it to the notice of the profession and the public

PSYCHOLOGY IN A CHANGING WORLD

It is frequently said that the world is changing so rapidly that the man in the street is quite unable to keep pace with or understand what is happening Perhaps this applies to no subject more than to psychology The devotees of psychology insist that it is now a science it is often discussed with a show of erudition in the public press, it claims to offer something for the solution of all sorts of contemporary problems, and yet it is looked at askance by many learned and responsible people Through this maze Professor Aveling[1] has sought, not unsuccessfully, to lead the earnest inquirer

To understand modern departures in this branch of study it is necessary to know something of the old psychologies, from the theoretical constructions of Aristotle through Aquinas and the school men to Descartes, Locke, and Hume, who each explored a path from the philosophical starting-point, and to Wundt, who began to try out experimental methods and so became the father of modern

results show sufficient success for some credit to be ascribed to the use of the vitamin even after complete placentation I wish to emphasize this point because as I have mentioned before some observers consider that the vitamin is of value only in the early months Naturally, some of these women might have gone to term unaided, as did two who failed to return until they were in labour

Wheat germ oil has also been given with success in cases of threatened abortion Fifteen of these have been so treated and fourteen taken successfully to term (Table II) Along with the administration of the vitamin the other recognized methods of treatment were used

Conclusion

In conclusion may I say that in vitamin E we appear to have a means of treating a most distressing condition with some hope of success Up to the present the amount of vitamin and the length of time it should be administered are open to discussion, but until further observations are made it would appear safer to give it throughout the whole of the pregnancy in a dose of not less than three minims of the oil extract daily

The Field Studies Department of the Institute of Sociology is organizing a winter school of sociology and civics to take place from January 1 to 8 In addition to a course of general lectures on sociological subjects by specialists there will be a systematic study of field work methods Kensington will be taken as the area for such studies and visits will be paid to a large number of historic social and economic institutions The natural features of the borough its history population, housing industry health and recreation will be surveyed The school is intended to meet the needs of members of the teaching profession, social workers and others interested in local history and modern social developments Particulars may be had from the Institute of Sociology, 35, Gordon Square, W C 1

psychology From this groundwork six main paths have developed The theory of knowledge has been explored and tested mathematically by Spearman and his colleagues with the result that the two-factor theory—that intelligence depends on a factor of general ability interacting with certain special abilities—has become the foundation of modern education The drive towards conduct has been elucidated in many ways, notably by the psycho-analytic school of Freud and its derivatives, who have studied the impulses and urges which act as a *vis a tergo*, and also by the hormic or purposive school—its most notable exponent is McDougall—who study the goal or purpose of conduct Both of these schools lay stress on the dynamism of emotion and feeling in contradistinction to the old conceptions of the forceful influence of ideas The Gestalt school has studied the method of apprehension of experience, attempts to correlate psychological with physiological concepts, and seeks to prove (with considerable success) that the mind works in terms of wholes which may be subsequently analysed into component details and does not work by a simple synthesis of irreducible units The older method of introspection has been elaborated and developed, while a special school of behaviourists has striven to work entirely by objective methods and by excluding consciousness from their field of observation

At first sight it would appear that all these different schools of thought merely bite their thumbs at each other and can only agree to differ, but more recently there is no doubt that in their practical application they are beginning to come together, for in many respects those who deal with applied psychology are finding that they can usefully draw from all these fields of inquiry Modern psychology is proving its use in many respects notably in education, both in the grading of intelligence and capacities and in the formulation of special methods in industry in the study of fatigue and its avoidance, and in fitting the individual for his job and in finding a suitable job for the individual In medicine the study of the psychoses and psychoneuroses has been much advanced but apart from this there is a considerable improvement in the understanding of how individual patients suffering from all sorts of illness react to their environment In criminology and law it is being realized that many crimes are expressions rather of disease and maladjustment than of vice, and so a fresh impetus is given to ensuring prevention of crime before it is too late

As to the future we may look for a simplification and a greater exactitude of psychological language which is very desirable and a *rapprochement* between the various schools so that the science of psychology may become coherent. Much still requires to be done to enable feeling and will to be understood and tested as can knowledge at present, and the conceptions of the dynamism of the unconscious and the wholeness of mental apprehensions promise fruitful fields for future research

THE NATURE OF THE ROUS AGENT

Is the immediate stimulus to malignant proliferation chemical or microbic? This is perhaps the greatest question in cancer research at the present day and both the possible direct and the unqualified answers to it have their adherents while needless to say there are others not prepared to affirm that all malignant disease has any single cause It is beyond question that much human cancer is due to the action of chemical "irritants" and the disease can be produced experimentally both by these and even more readily with the more recently discovered carcinogenic hydrocarbons On the other hand a number of malignant tumours in fowls and several innocent tumours in other animals are unquestionably caused by an agent which is recoverable from a filtrate of the tumour itself and is generally regarded as a living virus Attempts have been made to reconcile these facts and to formulate a unified conception of the origin of cancer by assuming that the immediate and persistent cause of malignant neoplasia is always a living virus and that when chemical stimuli appear to be the cause of cancer they act only by rendering cells susceptible to this virus There are a few workers who take quite the opposite view and far from belittling the chemical stimulus and exalting the virus to a position of universal significance seek to attack the virus in its own stronghold of the fowl tumours by questioning its living nature The agent of the Rous sarcoma the first discovered and best known of these tumours has been submitted to almost every conceivable form of physical and chemical treatment in order to elucidate its nature and there are records of the preparation of active extracts of such tumours by methods which might be expected to eliminate or destroy a living micro organism Further experiments on these lines are now reported by Jobling Sproul and Stevens [1] who have produced tumours with the material obtained by extracting dried tumour tissue with various lipoid solvents They attribute their positive results to precautions connected with temperature rapidity of manipulation and protection from oxidation during the process Only those familiar with such operations are qualified to judge the significance of this result which naturally depends on a good deal of technical detail but the authors statement that similar treatment applied to material containing the vaccinia virus gave an inactive product adds some weight to their argument. The description of their numerous experiments is accompanied by a condensed review of foregoing work on the nature of the fowl tumour viruses and by an elaborate and far reaching argument which it

"COMMON COLD"

AND

ANTI-CATARRH VACCINE (EVANS)

(LOCAL STRAINS)

For Prophylaxis and Treatment

The facilities of the pathological laboratories at **EVANS' BIOLOGICAL INSTITUTE** enable us to issue vaccines prepared from organisms collected in the locality in which the vaccine is to be used It will be appreciated that such vaccines are highly specific, producing a greater proportion of successful results than is possible with Stock Vaccines

The formulæ have been evolved after many years experience as having a comprehensive selection of organisms as found in numbers of typical cases in the correct proportions

EVANS "COMMON COLD" AND ANTI CATARRH VACCINES (Local Strains) are issued as follows

Boxes of 3 x 1 cc. Ampoules No 3 Vaccine (Prophylaxis) 7/6 per box Also in 5 cc., 10 cc. and 25 cc bottles

Boxes of 6 x 1 cc. Ampoules No 1 Vaccine (Treatment) 14/ per box and in single Ampoules

Made in England at EVANS BIOLOGICAL INSTITUTE by

Evans Sons Lescher & Webb Ltd.

Liverpool and London

'Panopepton'

In Refractory Cases

TO USE 'PANOPEPTON' in a case that has been proving refractory to both treatment and management is often to bring about an immediate change for the better in all the conditions—especially where there has been difficulty in getting nourishment adapted to the taste and toleration of the patient

'PANOPEPTON' is well designed to meet the essential desiderata of a **food for the sick**—in agreeability, assimilability, and substantial peculiar nutritive value

'PANOPEPTON' presents, in a form ready for absorption, the entire nutritious substance of beef and wheat It is a complete solution of all the nutrient, savoury and stimulant, nitrogenous and inorganic, constituents of these typical foods

Supplied in 12-oz bottles

A Free Sample will be sent to Members of the Medical Profession on request

Originated and Manufactured by
Fairchild Bros & Foster (Inc. N Y)

Proved efficiency with *pleasantness*

In spite of its high germicidal efficiency (Rideal-Walker 3·0) 'Dettol' can be used at strengths impracticable with carbolic and cresylic antiseptics It is non-poisonous, non-staining, pleasant smelling It has been shown that when 30% 'Dettol' is rubbed into the hands and allowed to dry the skin remains insusceptible to infection by haemolytic streptococci for at least two hours, unless grossly contaminated 'Dettol' is also stable in the presence of blood, pus, faeces and other organic matter

Obtainable from chemists in 1/- and 3/- bottles, and in larger sizes for medical and hospital use These prices do not apply in the Irish Free State and Overseas Samples and full information on request

RADIOSTOLEUM

(Standardised Vitamins A and D)

The ill-effects which arise from the all-prevailing shortage in the normal dietary of Vitamins A and D are counteracted by the administration of Radiostoleum, a highly active preparation which contains these two vitamins in accurately-standardised and properly-balanced proportions

The daily ingestion of two or three capsules of Radiostoleum, or their equivalent in the form of Radiostoleum liquid, aids in the preservation of epithelial integrity, thus preventing the inroads of infective organisms, particularly through the nasal cavities, the throat and respiratory tract

Sample on request

THE BRITISH DRUG HOUSES LTD LONDON N 1

is far from easy to accept. That active extracts can be obtained from the Rous tumour which contain very little protein or carbohydrate, but consist mainly of lipoids, is a proposition which this work carries a stage further towards acceptance and it is one which cannot easily be explained away But it is more questionable whether these facts have any relation to the high lipoid content of tumours generally, to the effect of lipoids on the growth of existing tumours or to the chemical structure of known carcinogenic compounds The last word on this subject is a long way from being said and for those without too rigid convictions the position is full of interesting possibilities

BEGINNINGS OF BRITISH OPHTHALMOLOGY

The belief that English ophthalmic literature began in 1622 with the publication of Richard Banister's *Breviary* and that at the start was tainted with literary piracy was questioned by Mr Arnold Sorsby at the last meeting of the Ophthalmological Section of the Royal Society of Medicine There was quite a considerable English ophthalmic litèrature before that date and the charge of plagiarism could not be brought against Richard Banister In its early stages, English ophthalmology was closely bound up with that of France, to its great advantage for French ophthalmic literature favourably dominated the specialty till well-nigh the middle of the nineteenth century, when progress in the study of eye disease took on a more international character The beginning of an independent French ophthalmology dates back to the publication in 1585 of *Maladies de l'Œil* by Jaques Guillemeau A few years later, at any rate before 1590, an English translation appeared going into at least two editions, and was apparently unobtainable by 1622, when Richard Banister with full acknowledgement, brought out a third edition and added a *Breviary* of his own Previous historians seem to have been more concerned with charging Banister with plagiarism than with assessing his own contributions to ophthalmology—and these were of no mean order He has left two highly important documents on the social status of oculists in the seventeenth century one being his *Breviary* and the other an unpublished manuscript recently discovered by Mr R R James He must also be credited with the first description of hardness of the eye antedating Mackenzie's rediscovery by over two hundred years Not only is there no reason to charge Banister with plagiarism and with quackery as Hirschberg and Casey Wood have done, but there is proof that he was a qualified and skilful practitioner a good observer and a pioneer in a new branch of knowledge Banister was not alone in his pioneer efforts Later in the century there was Daubigney Turberville who was the first to recognize colour-blindness and the first to use a magnet to extract a foreign body embedded in the eye There was also William Briggs the first to describe the optic disk and to name it papilla and to contribute to ocular physiology the discovery of corresponding points in the retina Throughout that early period there were a number of lesser publications on the hygiene of the eye, of no great significance ophthalmologically, and unauthorized and unacknowledged reprints of previous work The acme of literary piracy was reached with Sir William Read oculist to Queen Anne and well known to his contemporaries as a charlatan Of the two books credited to Read one is supposed to have gone into two editions and the other to be no longer extant This latter volume Mr Sorsby was fortunate enough to discover in the library of the Royal College of Surgeons, and was able to show that the three publications are all one and the same, the only difference being substituted title pages The incongruity of its contents led him to the further discovery that the book passing under Read's name was nothing but an unauthorized and unacknowledged reprint of Banister's *Breviary* and the third edition of the English translation from Guillemeau that Banister had brought out in 1622 The only additional material in Read's book consisted of a series of case reports on miraculous cures obtained by Read's "styptic water" and "dextrous hand" The ophthalmic literature of the sixteenth and seventeenth centuries thus represents an incongruous mixture of important original observations, insignificant expositions of ocular hygiene and an active trade in plagiarism That there was piracy cannot be doubted but overshadowing it is the excellent seamanship of seventeenth century pioneers of British ophthalmology

THE TRAINING OF NURSES

There is something wrong with our system of training nurses At a time when medical science is advancing in every direction, when new opportunities are always opening up for the well qualified nurse and when other careers are overstocked with applicants nursing appears to be losing its popularity and its appeal Numbers of our hospitals report a shortage of applicants, and almost all of them admit that they are failing to attract the better educated type of student So writes Dr Harold Balme as a justification for his little book of criticisms and suggestions [1] In seeking the reason for this state of affairs he finds that the present method of training nurses is both antiquated and inadequate It tends to stultify intelligence, not to educe it, to repress initiative, not to encourage it to dry up personal sympathy, not to foster it, to place the major emphasis upon *how* to perform certain duties, not on *why* they are important, and, in short, to develop quick and mechanical action rather than intelligent understanding in the fight against disability and disease He is a caustic critic of autocratic rule in hospitals "Many a young probationer has told me of occasions when she has been 'dressed down' by a sister in a way which no mistress however provoked would dream of using towards one of her maids unless she was prepared to see the girl walk straight out of the

[1] *A Criticism of Nursing Education with Suggestions for Constructive Reform* By Harold Balme M D F R C S H Milford, Oxford University Press (2s 6d)

forasmuch as the wedge shaped slice is made from the dorsum of the tongue, elevation of the tip must take place This method thus mechanically assists that organ to assume the position insisted on by those teachers who have been most successful in ameliorating this defect

The first operation was performed on January 7, 1841 I chose for this case the method by which a wedge-shaped portion is removed from the posterior part of the tongue for, as I have remarked I felt more confidence in this than in the other method

Frederick Doenau, a highly intelligent and talented boy of 13 years of age had stuttered from his earliest childhood and to so painful an extent that the defect was thought to be quite incurable [Apparently his stammer was a really bad one and the presence of a stranger affected him in a manner most painful to behold] The boy s mother caught eagerly at my offer to make an effort to cure him accordingly, with the assistance of Drs Holthoff and Hildebrandt, the operation was performed as follows The boy sat with his head leaned against the breast of an assistant, the tongue, being protruded as far as possible was grasped on its anterior half with the forceps of Müseux being thus compressed laterally, and drawn forwards by one assistant The gentleman against whose breast the boy s head rested retracted the angles of the mouth with a pair of blunt hooks Grasping now the tongue as near to its root as possible between the thumb and forefinger of the left hand, I passed the bistoury through it, and divided it completely from below upwards a strong ligature passed through the posterior edge of the wound served to fix it temporarily and to prevent too great a strain upon the slender band which alone connected the mass of the tongue to it the anterior lip of the incision was now grasped and laterally compressed between the modified hare lip forceps and a wedge shaped slice excised out of the whole thickness of the tongue It will be found more convenient to make this second incision from above downward and with a small straight knife The posterior edge of the wound was now, by means of the before mentioned ligature and a sharp double hook drawn so far forwards that the needles with the ligatures could be conveniently passed through it six strong sutures served to bring the edges of the wound together and to restrain the haemorrhage To effect the latter object they must include the whole depth of the wound within their loop That the haemorrhage was considerable may be imagined from the nature of the operation which should not be attempted by all persons indiscriminately As soon as the boy s mouth was washed out I desired him to pronounce some of those words which he had before found especially difficult, he did so without stuttering or hesitation.'

The boy was put to bed and soon recovered, so much so that on the tenth day after the operation he was presented by Dr Dieffenbach to His Excellency the Baron Humboldt, who testified the liveliest interest in the happy re-establishment of the boy

Frederick Kiel, son of a schoolmaster at Potsdam, 16 years of age, tall, slender, and intelligent, had stuttered badly for six years, following an inflammatory infection of the lungs The operation took place on January 19, 1841

'I followed nearly the same plan of operation as in the case before related, by which a portion of the tongue near the root was removed The tongue being drawn forward with Müseux forceps, a strong ligature was passed through it at its most posterior part and then pushing the bistoury through the tongue the incision was completed from below upwards. The anterior lip of the wound, as before was held between the forceps, and a wedge-shaped slice of three fourths of an inch in breadth at its top taken away in the whole thickness of the tongue the edges of the wound were brought together by means of six strong sutures the bleeding was not inconsiderable but it ceased after the application of the sutures. Immediately after the operation I made the young man repeat a few words which he did without any stutter whatever with the *gene* only that might be expected after an operation on the tongue Strict quiet was ordered for him and frequent rinsing of the mouth No particular constitutional disturbance followed the operation and except the swelling of the tongue the symptoms did not differ from a severe catarrhal inflammatory sore throat He had some difficulty in deglutition and his tongue was coated On the third day after the operation he had already quitted his bed and pronounced single words without difficulty On the fourth day the tongue was scarcely swollen at all, its motions were free and the patient could already pronounce a short sentence, he neither grimaced nor stuttered On the fifth day I drew out one suture and the others in the course of the two following days On the eighth day the wound was healed and the patient completely cured of his former most painful defect Many physicians who have seen him since that time can speak as to the complete success of this operation'

At the time of the publication of the book sixteen stutterers had been relieved The excised portions of the tongue consisted of parts of the genioglossus, some of the proper fibres of the tongue, and small portions of the styloglossus and hyoglossus

Herr Dieffenbach certainly impressed Mr Joseph Travers, but the reader is left wondering whether the good results claimed for this operation were not wholly psychological For when all is said and done, the operation was carried out in the pre-anaesthetic days!

WILLIAM BROCKBANK, M.D

Reports of Societies

BRONCHOSCOPY IN DIAGNOSIS AND TREATMENT

A combined meeting of the Sections of Medicine and Laryngology of the Royal Society of Medicine on December 3 was held for a discussion on the value of bronchoscopy in diagnosis and treatment Mr C A SCOTT RIDOUT was in the chair

Mr V E NEGUS, in opening, said that the original purpose of bronchoscopy was to remove foreign bodies, this called for constant practice, and no branch of surgery gave more satisfactory results Some cases of lung suppuration were found to be caused by foreign bodies which had not been suspected, and bronchoscopy (for both examination and treatment) was essential for a cure Even if the foreign body could not be removed its effects could be counteracted by bronchoscopic aspiration of secretions and improved drainage Afterwards lobectomy might be possible Bronchial abscess responded almost invariably to bronchoscopic treatment Basal bronchiectases did not respond well to this method, but some patients might continue to live happy and useful lives if periodical bronchoscopic treatment were carried out In the case of squamous celled carcinomata only palliative treatment was possible, but a good deal could be done to permit of aeration and drainage of lobes shut off by the mechanical obstruction of growths The cause of an unexplained haemoptysis could be determined by direct examination The method in cases of asthma was not justified

Dr L S T BURRELL said that in haemoptysis of unknown origin it was a matter of great importance to have a bronchoscopic examination made if the haemorrhage could not be explained in other ways It was sound to teach students that haemoptysis was due to tubercle, but there were other causes Frank carcinoma of a bronchus generally showed itself first either by slight haemoptysis or blocking of the bronchus and consequent collapse of the lung In those cases lipiodol would show the blocked bronchus, and that was strong evidence in favour of carcinoma He had been much impressed by the great increase in the scope of the thoracic surgeon in successfully removing not only a lobe of lung but an entire lung Bronchoscopy did much in determining whether a case was operable or not Nowadays bronchiectasis was largely diagnosed by x rays and lipiodol Many of these cases could be treated well by bronchoscopic aspiration

house" He maintains that the root of failure in the existing system lies in the attempt to combine the education of young probationers with the need for utilizing their labour in order to carry on the existing work of a busy hospital It is this that accounts for the long hours of duty the inadequate opportunities for rest and study and the various vexatious restrictions to which it gives rise This leads Dr Balme to his conclusion That we can never hope to have an ideal nursing college nor a really satisfactory method of training until nursing education is entirely separated from the responsibility of providing the nursing services of the hospital with which it is connected In other words, such a hospital must be adequately staffed with its own trained nurses and must not depend to more than a limited and minor extent upon such assistance as it may derive from the duties performed by the student nurses during their course of training He maintains that there is no question that what is deterring educated girls from taking up nursing as a career is the arduous and antiquated conditions which exist in the hospitals and that if these were removed and the whole status of nursing raised to a professional level by the shutting down of non approved training schools there is every reason to expect a large influx of well educated student nurses This is a book to be read by hospital governors be they laymen or members of the medical profession and it will no doubt be brought to the notice of the Interdepartmental Committee on Nursing lately set up by the Minister of Health and the President of the Board of Education

Q CAMPS

The problem of dealing with young people who offend against the law is one of the most pressing of these times So much of what is called juvenile delinquency results not from real weakness, but from a wrong attitude to life The delinquent offends against the law because he has never been trained in a sound moral and social outlook Prison is the worst possible thing for offenders of this kind—and indeed for offenders of most kinds—but the trouble is to know what to do with young people who need moral training Borstal takes a good many of the more troublesome ones but its methods are drastic and expensive Q Camps is the name of an organization which suggests one possible solution for certain boys and youths It is still in the experimental stage "Q" is meant to suggest a quest of inquiry and to obviate the drawbacks of a descriptive title There is as yet only one camp situated in twenty six and a half acres of land in a rural district not far from London It was started in May 1936 and is conducted on the principle of affording the fullest possible scope for learning a satisfactory mode of life by experience The camp chief is helped by an educational director and a specialist in gardening farm work and handicrafts There is room for about fifty members at present about thirteen are in camp They live under canvas in summer and in wooden huts in winter they grow vegetables and flowers look after poultry and goats do elementary carpentry and building, cooking and handicrafts play games act plays and learn many other kinds of activity They are between 16½ and 25 years of age and come from social organizations the courts' probation officers or at the invitation of friends They apply their own discipline themselves through the camp council The staff have the advice of a number of practising psychiatrists, whose word is important in the selection of cases The tolerant atmosphere of the camp is said by Dr Dennis Carroll one of its chief exponents [1] to afford scope for a non social member to discover with the minimum of resentment that the achievement of his wishes depends very largely on his degree of co operation with his fellows The success of such an experiment depends upon personal ability and achievement This venture has yet to prove its practical value and judgement must be suspended until it has been allowed time to do so

TULAREMIA

A few months ago A P Thomson G H Wilson and S McDonald[2] described three cases of a disease apparently contracted in Ireland in which lesions suggestive of tularemia were present in the liver of one of them. Certain features presented by these cases—the long incubation period the presence of a marked eosinophilia and the absence of specific antibody for *B tularensis*—definitely disposed of the idea that they were infections with that organism Dr Thomson and his colleagues although admitting this suggested that the condition described might have been due to infection with a hitherto unrecognized bacterium related to *B tularensis*, and this very naturally has aroused a keener interest in tularemia in this country Apart from the fact that it was a hitherto unknown bacterial species the discovery of *B tularensis* by McCoy and Chapin in 1911 attracted interest mainly because the disease caused by it in ground squirrels in California presented post-mortem appearances closely resembling those of plague Even when some years later the researches of Francis showed that human infections with this organism were occurring in the United States the source of this infection being certain species of wild rabbits the interest in this country still remained a somewhat detached one apart from one or two laboratory infections tularemia was unknown in these islands Since that time the situation has changed materially It is true that naturally occurring authentic cases of tularemia have yet to be found in Great Britain, but the geographical distribution of the disease has extended considerably It has been reported from most parts of America the rabbit fever studied by Ohara in Japan has been shown to be tularemia and cases have occurred in Siberia and in various parts of Europe, including Norway and Sweden. The report of the session of the Permanent Committee of the International Health Office[3] in May, 1937 draws attention to the extension of tularemia in

Dr EWART MARTIN (Edinburgh) raised the question whether, after all the profession had advanced far enough in this matter No endoscopic examination should be performed without a previous examination having been made of the pharynx, and it was very important that the operator should have good monocular vision He thought that much more use could well be made of the bronchoscope for both diagnosis and treatment The physician and radiologist must be the senior partners and in treatment the thoracic surgeon must take a share In his clinic the bronchoscopy was done under local anaesthesia, but for nervous patients he used avertin It was important to know when to call in the thoracic surgeon Sometimes the enthusiasm of a young man had led him to open a chest in cases which should not have been touched operatively, it should have remained in the hands of the physician In some recent medical textbooks there was not even a mention of bronchoscopic treatment even for cases of lung abscess

Dr H V MORLOCK said that in his hospital physician and radiologist were united in one person There was no doubt that every bronchiectatic patient should have a diagnostic bronchoscopy carried out In many such cases the bronchiectasis was secondary to some cause which only bronchoscopy could reveal Mr F C ORMEROD exhibited slides of some interesting cases from the standpoint of differential diagnosis and in which bronchoscopy clarified the situation completely Mr T B LAYTON thought Mr Morlock's paper showed endoscopy in this country was advancing along proper clinical lines and he hoped that before long it would be considered necessary to have whole time bronchoscopists appointed

INVESTIGATION OF STERILITY

At a meeting of the Devon and Exeter Medico-Chirurgical Society on November 25, with the president Dr R C NORMAN in the chair Dr MARGARET C N JACKSON read a paper on the investigation of involuntary sterility bringing to the notice of the society the work she and others were doing at the Exeter and District Women's Welfare Centre at the Exeter Dispensary

Dr Jackson explained that while methods of contraception were taught at the clinic to couples who were physically, mentally and economically unfit to have children conversely an effort was being made to investigate and treat the involuntarily sterile who wanted and were fit to have, children It might be assumed that roughly 10 per cent of all marriages were involuntarily sterile The factors involved were complex but in only some 30 per cent of sterile matings were the husband or wife or both absolutely sterile In the remaining 70 per cent there was only relative sterility In quite a high proportion the fault lay with the male—some authorities gave a figure as high as 57 per cent but she considered 20 per cent nearer the mark in this country

Factors in Aetiology

There were many factors to be taken into consideration (1) Natural fertility was always reduced in persons over the age of 30 (2) There might be some general condition —for example syphilis (3) Dietetic deficiencies and particularly lack of vitamin E might be manifested in the female by habitual abortion and in the male by abnormal spermatogenesis (4) Among the endocrine disturbances which might affect fertility were hypogonadism and other forms of endocrine imbalance evidenced possibly by a lowered basal metabolic rate menstrual abnormalities or anovular menstruation (5) Coital difficulties which might give rise to sterility were dyspareunia impotence relative disproportion a wrong position wrong timing in relation to the fertile period and certain psychological factors (6) Many local pelvic abnormalities in the female might affect fertility—for example maldevelopment, malposition or tumours of the uterus the type of bulky uterus associated with a history of abortion and menorrhagia infections of the cervix thickening or blockage of the tubes and cysts or other tumours of the ovaries (7) In the male such conditions as hypospadias phimosis, or undescended testicle might be at fault (8) Possible abnormalities of the seminal fluid were oligospermia, aspermia and azoospermia or perhaps a poor buffering power on the part of the fluid which was of special importance in cases in which the vaginal secretion was markedly acid Necrospermia was revealed by the examination of cervical smears taken soon after coitus

Absolute sterility in the male was dependent upon such factors as non descent of the testicles destruction of both these organs by trauma inflammation or new growth or blockage of the ducts Factors in the female were conditions such as imperforate hymen some forms of infantilism and hypogonadism destruction of both ovaries or complete blockage of the Fallopian tubes Setting aside the question of absolute sterility any one of the factors mentioned might alone be insufficient to affect fertility but when two three or more such factors were associated sterility would often result It was therefore important that a routine investigation of both partners should include an exhaustive inquiry into the history a careful physical and bacteriological examination of the genito urinary system estimation of the basal metabolic rate and a Wassermann test Much information of value concerning the husband could be learnt from the wife who was often advised to induce him to see his own doctor with a view to physical examination

Special Investigations

The investigation of the seminal fluid was of paramount importance and although examination of specimens of seminal fluid was the usual procedure it sometimes proved possible to arrange for cervical smears to be taken two to twelve hours after coitus and to observe the vitality of the spermatozoa in the cervical secretion The routine pelvic examination should include investigation of the patency of the tubes by insufflation or lipiodol injection and subsequent x ray examination If however air passed through the tubes at a pressure of from 80 to 150 mm of mercury there was no need to proceed further The question as to whether anovular menstrual cycles were present was difficult to determine but, on the assumption that basal temperature might give an indication Rubenstein of Ohio had suggested the taking of the rectal temperature every morning at the same hour under conditions of rest and fasting A fall of a degree or more tended to occur for a day or two before ovulation

Discussing the collection of semen Dr Jackson said that some condoms were lethal to sperms and should not be used for collecting specimens Dr J R Baker and his co-workers at Oxford had compiled a list of sheaths free from this disadvantage The transfer of the specimen to a glass tube immediately after collection was important The examination of the fluid included estimation of the volume (3 to 5 c.cm.) the number of spermatozoa per c.cm. (100 to 150 millions) and their degree of activity and the very variable resistance to the action of standard spermicides should be investigated It was also necessary to know the *p*H and the buffering power of the seminal fluid the longevity of spermatozoa and the effect upon them of certain acids Any structural abnormality of the spermatozoa was noted as also was the presence of other cells and debris With all the information obtained from both partners and keeping the list of possible operative factors in mind a process of elimination should help in arriving at the cause of the sterility At times the remedy might prove easy and almost immediate but in other cases much patience was needed on the part of all concerned Meaker of Boston now claimed that living

Lower Austria and its spread thence to Czechoslovakia as well as to an outbreak among the garrison of Luleburgaz in Turkish Thrace There is thus evidence that the disease is widespread in both the New and the Old Worlds and when one adds that the host range of this bacterium now includes hares wild rabbits, water voles, and some species of grouse, as well as ground squirrels and that some of these susceptible mammals are indigenous in this country the possibility of tularemia arising here is by no means remote Man becomes infected either through direct contact with an infected rodent or through the intermediary of a biting insect and infection enters the body by various routes the skin—particularly through cuts and abrasions—the conjunctiva, and the mucosa of the nose and throat. The disease takes various forms which fall into two main groups—the typhoidal and the glandular In the former, lesions at the portal of entry are minimal or absent and the infection becomes generalized from the start with the formation of multiple foci in the different organs particularly in the lungs In the glandular type of the disease there is considerable resistance to the infection as evinced by the development of a marked primary lesion and the enlargement of the glands draining the primary focus This type of tularemia is further divided into the ulcero-glandular the oculo-glandular, and the glandular, according to the site of the primary lesion the first of these is by far the commonest form for tularemia to take Pneumonia may be a prominent feature—in an analysis of 400 cases by Foshay[1] it was present in 18 2 per cent.—and many authorities consider this complication the chief cause of death from tularemia Foshay points out, however, that pneumonic lesions are present in only half the fatal cases and attributes the chief cause of death to septicaemia When on the lookout for cases of tularemia the points to bear in mind are that it occurs in those whose occupation brings them in contact with infected rodents—gamekeepers, rabbit catchers, poultrymen, cooks, butchers—and that the commonest form for the disease to take is an ulcer on the skin, usually of the hands or forearms associated with enlarged lymphatic glands and fever The laboratory investigation of the human disease is concerned with the demonstration of specific agglutinins in the patient's serum, providing evidence which is invaluable in the making of a correct diagnosis

RADIOLOGY OF THE CARDIOVASCULAR SYSTEM

Before the advent of radiology little could be discovered regarding the morbid anatomy of the heart during life Moderate or gross enlargement of the heart and aorta could be determined by clinical methods but slight changes in the size of the heart, various changes in its shape and a majority of lesions in the great vessels could at best be suspected or inferred from groups of clinical data The use of *x* rays in the study of the cardiovascular system has shown that the deductions drawn from certain clinical methods notably percussion have been erroneous In a recent monograph Dr H Roesler[1] has assessed the value of the various radiological methods of studying the heart and blood vessels and has brought together the great mass of researches that have been undertaken during the last quarter of a century The earlier chapters are concerned with the radiological study of the anatomy and dynamics of the normal cardiovascular system, teleradiography, orthodiagraphy and arteriography are discussed while such newer methods as volumetric reconstruction and kymography receive attention Succeeding portions of the work deal with the radiological aspects of cardiovascular disease from the point of view of aetiology the structural changes in disease, the use of the *x* rays in the examination of the aorta and pulmonary artery, and the radiology of pericardial disease and peripheral vascular disease Dr Roesler's exposition of these problems reveals the complexities that have always surrounded the radiological study of the heart Whereas this method in other departments of medicine has remained largely qualitative (as in diseases of the lungs and digestive tract) here the matter has become one of intimate anatomical relation and mensuration—for example the deviations produced in the trachea and oesophagus by enlargements of the heart and aorta and the determination of the limiting dimension of the silhouettes of the various structures in relation to age and build Further, these radiological studies have shown the close relationship that exists between the efficiency of the heart and the vascular state of the lungs The author shows on every page his intense interest in his subject, and this treatise bears the stamp of careful thought and personal observation

HONORARY PHYSICIANS TO THE KING

The King has made six appointments as Honorary Physician to His Majesty from the members of the medical profession engaged in public health work both in central and local government The appointments are made for a period of three years, and the following have been appointed in the first instance Sir Arthur MacNalty Chief Medical Officer, Ministry of Health and Board of Education, Sir Edward Mellanby, Secretary of the Medical Research Council Dr J H Hebb Director-General of Medical Services, Ministry of Pensions Dr J C Bridge, Senior Medical Inspector of Factories Home Office Sir Frederick Menzies Medical Officer of Health and School Medical Officer to the London County Council and Dr A S M MacGregor, Medical Officer of Health for Glasgow

The eighth annual reports of the National Radium Trust and Radium Commission for 1936–7, including a statistical report, are issued to day as a Command Paper (Cmd 5612), price 1s 3d. net Further reference to this publication will be made in an early issue

babies had been born to 47 per cent of previously sterile couples investigated and treated at his clinic, and even in her own small series of cases Dr Jackson had met with success—notably in some cases in which there had been twelve years of sterile married life

At the conclusion of Dr Jackson's paper a series of slides were shown and a colorimetric method for estimating the *p*H of fluids was demonstrated At the same meeting Dr M Y PAGET described in detail a recent case of arteriovenous aneurysm

RECOVERY IN THE SPINAL CORD

At a meeting of the South-West London Medical Society at the Bolingbroke Hospital on December 8, with the president, Dr E G HOUSDEN in the chair, Dr J PURDON MARTIN illustrated by lantern slides a paper on recovery in the spinal cord

Dr Martin said that recovery in the spinal cord, or at any rate recovery aided by man, seemed to be a relatively recent phenomenon He quoted from a volume by Dejerine and André-Thomas, published in 1909, in which it was stated that restoration of function was never or almost never observed in diseases of the spinal cord To us to-day that seemed an amazing statement, for we saw recovery of spinal function in many conditions It was instructive to consider whether the statement was justified in 1909 As long ago as 1887 Horsley had removed a tumour which was causing paralysis by pressure on the cord Recovery had resulted, and the patient had returned to work after a few months In the subsequent years there were very few such successes from similar operations, and by the end of the century only three cases had been reported in which good recovery of function had resulted after removal of an intradural tumour Twenty years after Horsley's operation only about twenty similar successful results had been obtained, so that, so far as spinal tumours were concerned, Dejerine and Thomas were justified in their statement Nowadays about a dozen operations for extramedullary tumour were performed every year at the National Hospital, Queen Square, alone, and recovery of function resulted in very many cases Of fifty cases in the years 1932–6, twenty-two were described as cured and twelve as improved at the time of their discharge from hospital, although recovery by then had often not reached its full extent There was thus marked recovery of function in 68 per cent of cases Compression of the cord from spinal caries was another condition in which recovery from paralysis now occurred, but was probably seldom seen in 1909 Such cases were now treated by postural methods

Non-surgical Conditions

Among medical conditions, recovery of spinal function now often resulted from treatment of the subacute combined degeneration of the cord associated with pernicious anaemia, a disease which formerly was always paralysing and fatal During the development of liver therapy there had been some controversy as to whether the improvement in the patient's nervous condition was due to recovery in the spinal cord or to recovery in the peripheral nerves and improvement in his general well-being, but now there was no doubt that great recovery occurred in the cord He instanced a case which he had shown at a clinical meeting of the Society in which the signs and symptoms were spinal and in which complete recovery had resulted It was necessary to give far more liver concentrate than was sufficient to keep the blood count up to normal, and it was usually about five months before definite improvement was seen Dr Martin also referred to recoverable forms of myelitis associated with infectious diseases, and said the belief that the syphilitic forms of myelitis were the most recoverable was a mistaken one However, acute syphilitic transverse myelitis had become very uncommon, and syphilitic spinal diseases in general seemed to be much less common than they used to be

He would have thought that Dejerine and Thomas might have been familiar with restoration of function in the spinal cord in the remissions of disseminated sclerosis That was one of the conditions in which it was most often seen to-day It had to be remembered that disseminated sclerosis was probably less common twenty-five years ago than it was to-day, but was it possible that there had been some change in the character of the disease, and that remissions were more frequent now than formerly? Of the diseases in which they failed to get any recovery the chief one was amyotrophic lateral sclerosis In poliomyelitis considerable recovery occurred and might go on slowly for years, but in localized areas in the spinal cord there was complete destruction of most of the anterior horn cells, and as these cells could not be replaced it seemed impossible that full recovery of the corresponding muscles could occur This belief would not prevent them from trying the methods of Sister Kenny, but he believed that her system was in danger of being brought into disrepute because the claims made for it by its adherents were excessive

Requirements for Recovery of Function

The requirements for recovery of function in the spinal cord were

1 Removal (or remission) of the cause of the spinal disease it was necessary that the cause should be removed without severe damage to the structure of the cord or interference with its circulation.

2 Absence of serious scar formation in or around the cord Subacute combined degeneration was more favourable than most diseases in this respect, and syphilitic conditions were unfavourable Because of scarring (glial overgrowth) it was important to treat nearly all diseases as early as possible

3 Provision of any substances that were known to be necessary for the nutrition of the cord Liver and vitamin A were instances of such substances.

4 Freedom from intercurrent infections, bladder infections and infected bedsores had a very adverse effect on the recovering cord, and every improvement in urinary antisepsis played a part in enabling better results to be obtained in spinal cases

Many members took part in the subsequent discussion, and Dr Martin replied to the questions that were raised

THE RETINA AND THE ROLE OF VISUAL PURPLE

The Thomas Young Oration was delivered before the Physical Society on December 9 by Dr R J LYTHGOE of University College, London, who took as his subject 'The Retina and the Role of its Visual Purple"

Dr Lythgoe said that the key to the understanding of the processes by which the energy of a light wave caused impulses in the optic nerve lay in the retina Owing to considerable technical difficulties the anatomical details of the retina were still imperfectly known, but recent work had added considerably to knowledge As a result current views of the rods had had to be modified It was found that about 400 of these structures of the retina responsible for vision at low illuminations must be served by one nerve fibre after the demands of the cones, the organs for visual acuity, had been satisfied The conger and other deep-sea fishes had retinae almost exclusively composed of rods, and these rods were fine and fila-

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

THE USE AND ABUSE OF ANTISEPTICS—I

BY

LAWRENCE P GARROD, M D, F R C P

AND

GEOFFREY L KEYNES, M D, F R C.S

"Haemostasis is effected and the wound cavity temporarily packed with gauze soaked in some suitable antiseptic (for example iodine carbolic lotion 1 in 20 Dakin's solution a strong solution of brilliant green or any other that the surgeon favours)

Rose and Carless's *Manual of Surgery* 1937

That three classes of antiseptic having totally different properties, not to mention others unspecified should be considered equally useful for a single well defined purpose illustrates well the somewhat hazy notions about antiseptics and their properties which are current among users Disinfection by chemical means is a curiously neglected department of medicine, and the most elementary principles connected with it are often imperfectly understood Antiseptics which have been in use for fifty years and more are so entrenched in their positions that no amount of condemnation appears to shake surgical faith in them, and the continued popularity of those with characteristic smells and colours even suggests that in this matter an appeal to the senses has a force at least equal to an appeal to reason That practice should be so diverse and misconception so common is perhaps not surprising in view of the fact that reliable information on this subject is scarce and scattered to arrive at any true comprehension of the properties of an antiseptic it is still necessary to consult original papers In some instances doubt still remains, the available evidence may be conflicting or composed largely of rudimentary experiments made thirty or forty years ago while sometimes pertinent observations and comparisons appear never to have been made at all. Nothing short of a fresh and comprehensive inquiry into this subject undertaken by *authority can dispel all the doubts which beset it. In* what follows we aim at suggesting a rational antiseptic technique in which opinion has an adequate basis in facts so far as they are known

Factors Governing the Action of Antiseptics

The destruction of bacteria (disinfection) or interference with their activities (antisepsis) by chemical means is attempted daily in proceedings ranging between proved usefulness and utter futility The value of such proceedings must be judged ultimately by their clinical results, but in devising or making a choice between them when such results are equivocal theoretical considerations must be given weight This is not the place in which to discuss theories of disinfection but it must be borne in mind that while the chemical destruction of bacteria anywhere requires that the agent used should be present in a sufficient concentration for a sufficient time to achieve this on the body involves two if not three, other considerations of the utmost importance The foremost of these is the effect on the agent used of admixture with body fluids and other material Many antiseptics are inactivated in such an environment owing to immediate chemical combination with body proteins some, on the other hand, are not. It has next to be considered whether the damage to tissues, whether gross or only microscopic, will outweigh the advantage possibly gained by killing bacteria, some antiseptics are caustic or irritant, others comparatively bland. Thirdly, it is sometimes of interest to know whether an antiseptic is capable of penetrating or diffusing through tissue These are the factors upon which success depends and before considering specific uses we must determine how far the properties of various antiseptics enable them to overcome these obstacles

Properties of the Principal Classes of Antiseptics

We have space to deal here with only five principal classes of antiseptics examples of others will be mentioned later, while some of lesser importance will necessarily be omitted

The Halogens—Iodine and chlorine in various forms are extensively used in surgery Both of these substances will rapidly destroy almost any kind of micro organism unprotected by other material even in extreme dilution the amount of chlorine required to disinfect a swimming bath is only 0·4 part per million On the other hand, both combine with and are consequently inactivated by all sorts of organic matter, and for effective action their concentration has to be increased in accordance with the amount of such material present an increase adequate to certain purposes may be considered impossible especially since strong solutions of both are highly irritant Thus iodine is an efficient disinfectant of the intact skin but admixture with more than a certain amount of blood destroys its activity The chlorine liberated from materials such as eusol and Dakin's solution combines with proteins in the exudate of a suppurating wound and whether its continued renewal can overcome this difficulty is disputed. Chloramines and the more recently introduced azochloramid are said to retain some of their activity in the presence of proteins Iodoform has no antiseptic value as such, it is said to liberate iodine in tissues—an ancient belief lacking modern confirmation Such benefits as are secured by this and other irritating but germicidally inefficient compounds are possibly due to the exudation of fluid caused by their presence

Oxidizing Agents—Antiseptics of this class are less irritant than the foregoing but are equally prone to inactivation by organic matter of all kinds In experiments by one of us the bactericidal activity of potassium permanganate was reduced by 95 per cent on the addition of 5 per cent of blood to the test mixture, while that of hydrogen peroxide was abolished altogether Of these two the former is certainly preferable but it is doubtful whether circumstances ever occur in surgical practice in which its use is clearly indicated The notion that antiseptics which liberate oxygen have a special action on infections by anaerobic bacteria, although natural is ill founded it assumes that this type of antiseptic action is exerted in the tissues and this is inconceivable

Salts and Compounds of Heavy Metals—Mercury occupies the foremost place in this class The bactericidal action of mercury salts is exceedingly slow and sometimes more apparent than real. These substances should never

mentous The fineness of the rods in the conger's retina could not result in a higher resolving power of its eye, since some 1,600 rods must be attached to one nerve fibre It was suggested that visual purple the light sensitive substance found in the rods, was adsorbed on their surfaces, and that the large number of rods in the conger, by increasing the quantity of visual purple, improved the animal's vision at low illuminations The various methods by which visual purple could be extracted from the rods suggested that true solution of the substance was obtained only when the rod envelope was completely disintegrated The increase in visual purple would not have a great effect on animals living at very great depths where only a narrow band of wave lengths was transmitted Deep sea fishes also improved their vision at low illuminations in other ways—namely by having large aperture eyes, and also by the movements of pigment which protected the rods and their visual purple during exposure to light The eyes of the monkeys had been shown to possess a remarkable adaptation to habit day hunting species having a cone type of retina night hunting forms having mostly rods, while in addition the retina was lined with tapetum which appeared to act by reflecting light back on to the rods

Recent work on visual purple had shown that the quantum efficiency of the bleaching process was about unity, and in addition visual purple had a high extinction coefficient Photochemically light produced a maximal effect on visual purple The bleaching of visual purple by light did not result in colourless products but in the production of a yellow substance with acid base indicator properties There were probably other intermediate products of the bleaching The presence of these coloured breakdown products in high concentration might considerably modify the perception of light of different wave lengths, and if present in concentrations of 100 of the yellow substance to 1 of visual purple would probably shift the wave length of maximum luminosity from a scotopic value of 505 mμ or so to a photopic value of 515 or 520 mμ This was not enough to account for the Purkinje shift and it had to be concluded that the secrets of the cones and colour vision were still far from solution

VITAMIN B AND NICOTINIC ACID

In an address to the Birmingham University Biochemical Society on December 9 Dr LESLIE HARRIS of the Cambridge Nutritional Laboratory referred to the findings in some current work on the chemical nature of the pellagra preventing factor

Dr Harris said that the suggestion of a connexion between nicotinic acid and vitamin B was not a new one About twenty four years ago Funk in England and Suzuki in Japan had succeeded in isolating nicotinic acid from active anti neuritic concentrates and it was once supposed that nicotinic acid might in some way be related to vitamin B_1 Later investigations had proved conclusively that pure nicotinic acid itself had no anti neuritic action and there the matter was left for some years although the possible physiological importance of nicotinic acid was emphasized by Euler's discovery that the acid amide of nicotinic acid was a component of cozymase Recently however it had been found that nicotinic acid or its amide had a growth promoting action for certain micro-organisms (Knight, Mueller Holiday) or for pigeons or rats kept on various diets deficient in some portion of the B complex (Funk and Funk Frost and Elvehjem) Special importance had attached to the statement of Elvehjem and his co-workers that nicotinic acid or its amide was curative of "black tongue" in dogs and work had now been done to link these new results with observations made at the Cambridge Nutritional Laboratory a year or so ago Here experiments by Birch, Gyorgy, and himself had shown that what had hitherto been called vitamin B consisted in reality of three distinct factors—namely lactoflavine vitamin B (the rat dermatitis factor), and the pellagra preventing factor proper The latter appeared to be identical with the anti black tongue factor for dogs More recently he had confirmed these results as to the tripartite nature of the vitamin B_2 complex and had shown furthermore that monkeys also developed a disease (monkey pellagra) analogous with human pellagra when given a diet deficient in the pellagra preventing factor but containing the other known constituents of the B_2 complex

Experimental and Clinical Trials

A trial of nicotinic acid on monkeys which were developing symptoms of nutritive failure on a diet deficient in the pellagra preventing factor now indicated that this substance had in fact a curative action further work was needed however to ascertain whether nicotinic acid was the sole deficiency in such a diet Nevertheless these results and the findings of other workers seemed sufficiently encouraging to warrant a trial on human beings suffering from pellagra Through the collaboration of Dr A Hassan of the Faculty of Medicine Cairo tests under controlled conditions had been made on pellagrins in Egypt In preliminary trials two cases of spontaneously occurring pellagra at the Khanka Asylum and three at Abuzaabal Prison had been examined together with three controls All variables such as the composition of the basal diet the amount of work done daily and the extent of exposure to sunlight, were kept unaltered for all subjects Nicotinic acid given by mouth up to a maximum level of 1/3 gramme daily was found to hasten the subsidence of the erythema in all the cases At the asylum the general condition of the pellagrins was likewise improved but at the prison the beneficial effect seemed largely limited to the specific action on the erythematous lesions It might safely be concluded therefore, that the nicotinic acid duly rectified a deficiency in these pellagra producing diets The results made it seem likely that the prison diets were deficient in some additional factor and in fact the asylum diet did contain more meat and more greens was better prepared and included some wheaten bread—the bread at the prison consisting of one quarter of maize The possibility had therefore still to be borne in mind that nicotinic acid was not the sole major deficiency in some pellagra producing diets—in other words that pellagra as sometimes seen might be accompanied by more than one dietary error Apart from this it seemed probable that nicotinic acid or its amide was the less active form or precursor of a more active variation of the pellagra preventing vitamin which could be formed from it within the animal body

At a meeting of the Manchester Medical Society on December 1 1937 the president Professor W FLETCHER SHAW introduced Professor R W JOHNSTONE who delivered an address on some contacts of medicine and obstetrics He drew attention to the significant part which the association of medical diseases with pregnancy played in the production of maternal mortality This was illustrated by statistics from the English reports on maternal mortality and morbidity of 1930 and 1932 and the Scottish report of 1935 on the same subject as well as by other figures The main contributory disease groups were found to be heart disease non tuberculous respiratory diseases and kidney disease The proper treatment of diseases associated with pregnancy depended upon an understanding not only of the disease processes but of the nature of the strain to which pregnancy subjected the various organs of the body The importance of close co-operation between obstetricians and physicians in the treatment of these cases was emphasized

be used when rapid action is desired ('rinsing" in mercurial solutions implies a total ignorance of their properties), nor are they effective in the presence of serum proteins, with which they combine Bacteria apparently killed by mercury perchloride may resume growth if treated with ammonium sulphide to precipitate the mercury or if placed in a medium containing blood A vast amount of experimental work has failed to take this fact into account, and a grossly exaggerated idea of the bactericidal power of this substance has consequently been current for many years Mercury biniodide is a weaker antiseptic than perchloride and somewhat less irritant Among compounds of mercury the best known, mercurochrome, is by far the least efficient, and only the strongest solutions used under the most favourable conditions are likely to have any effect On the other hand, phenyl mercuric nitrate, metaphen, and merthiolate are much more bactericidal than mercury perchloride, they suffer the same disadvantage of being largely inactivated by serum proteins and still more by blood

Coal-tar Derivatives—The distillation of coal tar yields a series of compounds, beginning with phenol, which is soluble in water, moderately bactericidal, and exceedingly poisonous, and proceeding, with increase in the temperature of distillation, through others in which bactericidal power increases and toxicity and also solubility diminish They furnish two classes of antiseptics solutions of phenol and of cresols (lysol), which are ideal for *in vitro* disinfection but too caustic for application to the body, and emulsions of tar acids of higher boiling point which are more bactericidal and less caustic, and therefore more suitable for bodily use, such are izal, cyllin, and many others Recently several antiseptics have been produced, the first of which was dettol, in which the active constituent is a pure substance of this class combined with chlorine instead of a mixture of several, these are less bactericidal than the foregoing, but are comparatively bland and hence applicable in greater concentration or even undiluted

Whereas the activity of phenol and cresols is well maintained in the presence of organic matter, that of emulsified disinfectants in this class is depressed by it to a varying and greater, but not extreme, degree, appropriate concentrations are experimentally effective in the presence of such materials as blood and serum All disinfectants of coal-tar origin vary in activity with temperature more than any others, warm solutions may be many times more effective than cold

Dyes—This term covers a large variety of powerful antiseptics, some having interesting but highly specialized actions with which we have no space to deal A distinctive place among them is occupied by the acridine compounds, of which an example is acriflavine, since these are the only substances which have been proved by controlled animal experiment to be capable of averting wound sepsis They kill or prevent the growth of pyogenic cocci in extreme dilution, act slowly, and in some cases are more bactericidal in serum—a unique property They are also relatively non-toxic, sufficient concentrations for antiseptic action demonstrably leaving the activities of leucocytes unimpaired, this property is also unique It is therefore possible to infiltrate tissues with solutions in order to prevent infection or to arrest it at an early stage

We now come to the practical application of such facts as these Let it first be understood that choice depends on purpose, there is nothing more foolish than to suppose that because this or that compound is a "good antiseptic" it should be employed for any purpose whatever Quite different considerations govern the choice of an antiseptic for use in the body or outside it. In the body an antiseptic will have two main purposes—the prevention and the treatment of infection, with their separate indications—and many different kinds of environment must be considered, according to the site of application and the conditions existing there

Chemical Disinfection Outside the Body

Among the many materials used in surgery some are best sterilized by heat, others require chemical treatment Three factors govern the choice of agents for such purposes their efficiency, their freedom from corroding or other spoiling action, and their cost. The last of these is of most importance in choosing an agent for what may be called gross disinfection, since large quantities may be required for disinfecting furniture, linen and towels, utensils, and excreta Either carbolic acid (5 per cent) or lysol (2 per cent) is commonly employed for such purposes, and both these substances are well suited to them Lysol is not only a little more than twice as strong a disinfectant as carbolic acid, but is also at present half the price, its use therefore involves only one quarter of the cost of using carbolic acid Izal (1 per cent), Jeyes' fluid (1 per cent), and other emulsified disinfectants are also suitable for such purposes, and are economical

Instruments—The ideal method of sterilizing all metal instruments is by dry heat, though in this country the necessary equipment is rarely to be found Boiling, preferably in 1 per cent sodium carbonate, is advocated by some, even for scalpels Those who prefer not to subject sharp instruments to heat should keep them in a mixture of 1 part of lysol with three of spirit The common practice of 'sterilizing" scalpels in spirit alone, and indeed the use of spirit for various other purposes, raise questions of considerable doubt In numerous experiments undiluted alcohol has been shown to have only a weak bactericidal action, and from some of these it appears that under certain conditions staphylococci may survive in it for half an hour or even several hours, while some reports allege that spirit may itself contain living bacteria, doubtless in the form of spores That *these are completely resistant to its action has been* shown by demonstrating living sporogenous bacteria in material which has been immersed in spirit for twenty years and more The bactericidal action of alcohol is undoubtedly increased by dilution with water to an optimum strength of 70 per cent and by the addition of a trace of alkali, but spirit so treated would be unsuitable for some of the purposes for which it is used Although the employment of spirit as an antiseptic is almost universal, and may be said usually to give satisfaction, we venture to suggest that its suitability merits careful re examination

Catheters—Special considerations apply to non-metallic instruments, and among these a difficult problem is presented by catheters made of material that is spoiled by prolonged heat Exposure to formalin vapour, which should be continued for a minimum period of four hours and preferably overnight, cannot be depended on to sterilize the inside, since diffusion through so long and narrow a tube as a ureteric catheter in particular is too slow a process The 'formalin cabinet' commonly used for catheters is not in fact claimed by its manufacturers to be capable of sterilizing their insides A more reliable

Local News

ENGLAND AND WALES

The Thames Estuary and the Problem of Sewage Disposal of Greater London

A Chadwick Public Lecture with this title was given by Dr William Butler at the London School of Hygiene on December 7 He said that the importance of the estuary among the health conditions of London could not be exaggerated It was not merely the largest open space of the metropolis, but if unpolluted would function as the parks did in renewing the atmospheric oxygen and restoring centrally other health agencies Pollution of the estuary above and below the sewage outfalls of the London County Council was now very serious At times the whole of the dissolved oxygen in the waters of the estuary throughout the county of London entirely disappeared as a result of sewage pollution carried upstream through London by tidal resurgence The sedimentation of the grosser solids of the sewage, carried out at Barking and Crossness and recognized at the time when initially provided as of a provisional character, was now utterly inadequate Dr Butler urged the necessity of providing a barrage to prevent resurgence of the contaminated water As to purification of the sewage, the L C C had provided or had in hand work for treating about one fifth of the total volume, if its reception were limited to the waters below the barrage—a much simpler task Purification of the still limited character at present aimed at in the new plant should be extended till the whole of the sewage of the main drainage of London was to that degree treated London s population was still moving out beyond the county boundaries and was already greater than that within The difficulties of sewage treatment in outer London had been considered in the 'Report on Greater London Drainage of 1935, issued by Sir George Humphreys and Mr Pierson Frank The lecturer expressed agreement with its recommendations that all arrangements for sewage disposal in and around the metropolis should be co ordinated and planned The need for such unification was urgent. Proposals for the treatment of sewage in ten or fewer centralized disposal works distributed throughout Greater London, and sited with a view to possible ultimate conveyance of the sewage to Dungeness, there to be discharged into the sea, together with the rest of London s sewage, were criticized by the lecturer, who contended that the whole of the sewage of Greater London should be brought as originally intended into the main drainage system of the metropolis, which already dealt with about three quarters of the total, and that this sewage should all be conveyed to the lower estuary below the proposed barrage and after adequate treatment, there discharged The sites owned by the London County Council at the present sewage outfalls were sufficient for this A pure Thames above the barrage would thus be ensured while below the condition of the estuarial waters would be improved beyond comparison

Certifying Factory Surgeons' Dinner

The annual dinner of the Association of Certifying Factory Surgeons was held at the Langham Hotel, London, on December 8 with the president, Dr T E Flitcroft, in the chair The Factory Department of the Home Office was proposed by Dr E H Strange, who pleaded for a closer co operation between certifying factory surgeons—to be known under the new Factories Act as examining surgeons—and the district inspectors and other permanent officials of the Home Office In replying, Mr D R Wilson Chief Inspector of Factories, though refusing to commit himself did hint that the opportunity given by the new Factories Act for a revision of the remuneration of certifying factory surgeons would be taken Dr J C Bridge, Senior Medical Inspector of Factories, also replied to the toast and in paying tribute to the work done in preventive medicine by general practitioners in their capacity as certifying factory surgeons told some stories about Form 190 The toast of 'The Association of Certifying Factory Surgeons' was proposed by Dr G C Anderson, who drew attention to the fact that the British Medical Association s proposals for a general medical service for the nation were undergoing revision He said that the B M.A would welcome any contribution to that revision which the Association of Certifying Factory Surgeons would care to put forward It had lately been suggested that school medical records would soon be available to panel practitioners, he thought that it was just as important that the records of the certifying factory surgeons should be available in the same way The president, Dr Flitcroft, gave a brief history of the Association of Certifying Factory Surgeons and its development under successive Factory Acts Concluding his long and interesting speech, he said that the relations between the Factory Department of the Home Office and the association had never been more cordial The toast of 'The Visitors" was then ably proposed by Dr L P Lockhart, and on behalf of the many distinguished guests Sir Ernest Graham-Little and the Rev Robert R Hyde replied

Old Epsomian Dinner

Members of the Old Epsomian Club gathered in force at the Café Royal on December 9, when the club celebrated its diamond jubilee Nearly 120 old boys and their guests were present Dr S Duke Turner, last year s president, again took the chair, in the regrettable absence of Lieut Colonel W L Crawford, D S O, this year s president, affectionately referred to as the Lord Nuffield of the College for his recent benefactions to his old school The toast of 'Floreat Epsomia" was replied to by the head master, the Rev A C Powell, who took full use of the opportunity to record the still further progress the school had made in the last year A survey of the work and the play showed a standard in each which most schools would find hard to beat The growth in the numbers at the school to a total of 500 had necessitated considerable additions to the teaching staff, and a heavy capital outlay on new buildings, which as usual the council had provided as soon as the request was made Mr D S Clogg, one of the joint honorary secretaries of the club in a happy speech proposed the toast of The Visitors, paying great tribute to Lord Leverhulme, president of the school, for his active interest in all its affairs

There are not many men,' he said, 'who would have altered important dates in their own large organizations in order to preside at the annual general meeting of Governors of a school one day and at its Speech Day the next' Among other guests to whom particular reference was made were Sir Cuthbert Wallace, President of the Royal College of Surgeons, Dr Henry Robinson, chairman of Epsom College Council, and Mr D C Bartley, vice chairman Referring to Mr A P Herbert s unique method of addressing the House of Commons in verse, Lord Leverhulme said that while he had never aspired to a seat in the House of Commons, and while he would never dare to address the House of Lords in poetic strain he did feel that he might address this, perhaps the third most august body in the country, in such a manner Then, to the delight of everybody, he made a clever speech in poetry which took the gathering by storm Sir Cuthbert Wallace, who also replied for the visitors, paid tribute to numerous old boys of the school who had worked under him and with him for a long period of time Although in a minority perhaps, he was one of those who still felt that boys would be better fitted for all kinds of work in after-life if they pursued general and literary studies right up to leaving school, and only took the first of their professional examinations after doing so

alternative is immersion in 0 1 per cent. mercury perchloride for at least one hour, the lumen being filled with the solution by means of a syringe, and freed from it before use by similar treatment with sterile distilled water Thorough cleansing, particularly of the eye of the catheter, is indispensable before sterilization by any chemical method can be effective

Suture Materials—Nine recent examples of post-operative tetanus derived from catgut revealed the fact that long discredited methods of sterilizing catgut were in use, and some of these methods are still recommended in surgical textbooks Catgut is a dense and impervious material, to destroy spores embedded in it is the hardest task a disinfectant can have, and quite beyond the powers of many that are efficient enough elsewhere Be it said again with the utmost possible emphasis that exposure not merely for days but for weeks, months, or even years, to spirit, mercury perchloride or biniodide, chromic acid essential oils, or 5 per cent carbolic acid will not sterilize catgut Nor will dry heat or hot xylol, heat is only applicable during the process of manufacture

Material sold under the description of "sterile surgical catgut' may not be manufactured in this country except under licence, and is dependable for sterility The term boilable applied to such catgut refers only to the fact that the tubes containing it can be so treated in order to sterilize their outsides before opening without damaging the contents It raw or partially sterilized catgut is to be used there is only one way in which it can be completely sterilized, and that is by immersion for ten days in Claudius s solution (1 per cent iodine 1 5 per cent potassium iodide in distilled water) Other suture materials are neither so dangerous nor so susceptible to damage Silk may be boiled (theoretically it would be better autoclaved) and stored in either 5 per cent carbolic acid or 0 1 per cent mercury perchloride Silkworm gut is treated similarly

Anaesthetic Apparatus—Rubber face masks should be immersed after cleaning in 0 1 per cent. mercury perchloride for at least one hour, or if this delay is inconvenient in 5 per cent carbolic acid or 2 per cent lysol for fifteen minutes, thorough rinsing is necessary after the latter treatment, or the next patient s face may suffer The extensible concertina tubing employed in some anaesthetic apparatus can harbour a quantity of secretion and multitudes of bacteria in its crevices it should be similarly treated, and carefully dried before further use

(To be concluded)

A Riley and H I Suby (*New Engl J Med* October 14 1937) who record a personal case state that the genito urinary complications of typhoid fever include retention of urine polyuria albuminuria pyuria haematuria haemoglobinuria urobilinuria, bacilluria infarcts and abscesses of the kidney nephritis pyelitis cystitis epididymitis and orchitis, oophoritis salpingitis gangrene of the genitals disturbed menstrual function and premature labour The authors case was that of a man aged 30 with no history of venereal disease who in the first week of typhoid fever developed prostatitis and vesiculitis Throughout his stay in hospital repeated urine cultures were negative for *B typhosum* but cultures of the prostatic secretion were positive Complete recovery finally took place. No previous examples have been recorded of prostatic invasion with typhoid bacilli in a living patient. Marchildon and Pick, however have reported two cases in which typhoid bacilli were cultivated post mortem from the prostate in one and the seminal vesicles in the other

BRITISH HEALTH SERVICES

A COMPREHENSIVE AND CRITICAL REVIEW

P E P (Political and Economic Planning) is an independent non party group consisting of more than one hundred members who give their spare time to sociological studies Its latest achievement is a *Report on the British Health Services*[1] which has taken three years to compile and the material for which has been drawn from two hundred persons or organizations It is one of those objective treatises of which an outstanding example is Charles Booth s work on the life and labour of the people of London written out of abundant information, dispassionate but sympathetic and progressive P E P works anonymously but the report reveals the expert hand It is written with inside knowledge, but in a spirit of critical detachment The section on the British Medical Association, for example, is an admirable statement If it has a fault it is that the Association is represented entirely as a central legislative body whereas it possesses a strongly organized periphery Frequent reference is made to the Association s Proposals for a General Medical Service for the Nation its Hospital Policy,' the exhaustive and challenging report of its Physical Education Committee, and the recently framed ethical rules for industrial medical officers—"a good example of the free development of new ideas within the framework of well tested and time honoured ethics

Scope of the Survey

This survey is one of the most difficult tasks P E P has undertaken, although it has tackled such subjects as international trade and the development of social services The difficulty arises from the bewildering number of fragmentary and often conflicting specialisms and the differences of attitude and approach The health services are like a big old hospital which has had to make numerous extensions and annexes and has lost its unifying centre The survey begins with the impersonal protective services including housing and sanitation passes to the health of the industrial worker also largely an impersonal service and reaches the individual in the services for mothers and infants, the pre school child, and the school medical service Then follows a description of the organization of the medical profession, the training of the student the working conditions of the general practitioner, consultant and public health officer and the allied services such as nursing dentistry and pharmacy The way is then open for a broad consideration of national health insurance, its defects and anomalies and the respective places of voluntary and council hospitals After touching on medical research nutrition physical education and psychological medicine the report concludes with an assessment of the annual cost of ill health which runs well into nine figures

It is not until all these matters are brought within the covers of one crown quarto volume of 400 pages that one realizes how large and complex they are There are 19 000 insurance practitioners in Great Britain giving 50 million attendances a year More than 5 million people participate in hospital contributory schemes A thousand voluntary hospitals treat in a year 1¼ million in-patients and nearly five times as many out patients Nearly 500 convalescent homes help a quarter of a million persons to get fit after illness More than 150 000 mental patients are maintained out of public funds The health of the school child in England and Wales is looked after by the equivalent of 700 whole time doctors Some 14 700 dentists make a valiant attempt to look after the nation s teeth, and 8 000 district nurses bear much of the burden which the daily care of ill health lays upon the community How do these services work? How do they fit together?

---

London County Council

It was reported to the London County Council at its meeting on November 30 that Dr J D Rolleston medical superintendent of the Western Hospital and small-pox consultant, would retire from the Council's service in February next on attaining the age of 65 Dr Rolleston entered the service of the Metropolitan Asylums Board in 1900 and was appointed to his present position in 1926 Reference was made to the zeal and ability with which he had carried out his duties in the Council's service After being advised that many patients with chronic eye disease in the Council's Whiteoak school for children would recover more quickly if put on a special ketogenic diet containing more fats and less carbohydrates than the normal dietary, it was decided last year to introduce the new diet for a trial period of twelve months On the whole the results have been satisfactory, and it is proposed to extend the experiment for a further twelve months at an estimated cost of £1,700 It is anticipated that in connexion with the residential treatment of tuberculosis in voluntary institutions under the Council's tuberculosis scheme an average of 1,250 beds for civilian adults will be required during the year This is nearly 100 higher than the original estimate and the reasons for the increase are that a smaller number of beds at the Council's special hospitals are available than had been anticipated that more notifications have been received during the first nine months of this year than in the corresponding period of 1936, that the experience of modern treatment of pulmonary tuberculosis by surgical methods indicates that a favourable result can be obtained in a greater number of cases if they are retained for longer periods under residential treatment, and that more beds are required for patients in settlement sanatoriums and for patients who are otherwise destitute or who would have to return to unsatisfactory home conditions

Joint Tuberculosis Council

At the November meeting of the Joint Tuberculosis Council twenty three members were present and there was a very full agenda. Skiagraphic terminology was considered and a committee comprising Drs G Jessel (convener) James Watt W H Dickinson G H Hebert, and W Burton Wood was appointed to consider this question and report thereon A memorandum was presented by Dr Blackmore concerning holidays with pay and it was resolved that in the considered opinion of this Council the provision of compulsory holidays with pay would be a great forward step toward the promotion of public health The honorary secretary Dr Ernest Ward was asked to send a copy of this to the Ministry of Health and to the secretary of the Government committee dealing with the subject The shortage of nurses was discussed and the Infection Committee together with Drs Lissant Cox Roberts McDougall and Heaf were asked to prepare and arrange for the submission of evidence to the Departmental Committee Investigating the Nursing Services A very important memorandum on the Government's milk policy was presented by Dr Hawthorne on behalf of the Milk Committee After describing the present position the memorandum regretted the delay suggested in enforcing pasteurization orders and criticized the use of the word accredited The object of the memorandum, which will be sent to the Ministries of Health and Agriculture and medical Members of Parliament is to secure the supply of safe milk to all consumers

Consultants for Mental Observation Units

At three of the mental observation units of certain hospitals of the London County Council—namely St Alfege's and St Clement's Hospitals and St Pancras Institution—consultants outside the Council's service are to be employed These will be men and women of consultant status who have had previous experience of mental services The need for such officers only arises at these three hospitals where the size of the mental observation unit warrants the services of a consultant for two sessions a week The arrangements at the other three units—Fulham St John's and St Francis's Hospitals—which are visited weekly by medical officers in the mental hospitals service are satisfactory and to be continued It is proposed that the positions of consultants in mental diseases should be created from February 1 at the three units in question for duty for a total of six sessions a week at the rate of remuneration prescribed for consultants and specialists generally—namely £200 a year for two sessions a week and £75 a year for each additional session plus payment for emergency visits at the rate of two and a half guineas It is not anticipated that more than very occasional emergency visits will be necessary

SCOTLAND

District Nursing in Scotland

At the annual meeting in Edinburgh on December 3 of the Scottish Branch of the Queen's Institute of District Nursing Dr J M Mackintosh Chief Medical Officer to the Department of Health for Scotland said that women particularly in rural areas should be confined in the home as far as possible and not in institutions This was desirable unless there was some abnormality which required hospital treatment or the patient's home conditions were so unsatisfactory that the services could not be safely carried out there He was gratified to see the close co operation between the Department of Health and the Institute of District Nursing in the Highlands and Islands where the nurses were held in high regard He looked forward to seeing in country districts generally an amalgamation of the two great services of district nursing and midwifery The Queen's Institute had a good record in regard to the reduction of sepsis The days were gone when all that was necessary to make a good nurse was a loving heart an object in life and inability to do anything else and it was the duty of the public in order to get good nurses to secure attractive conditions of training attractive pay and prospects variety of interest and in particular the provision of refresher courses and the continuance of interest among nurses during service The Duchess of Richmond and Gordon chairman of the Scottish Council said that the council had decided to raise nurses salaries from January next as salaries were raised in England last year The number of cases nursed during the past year was 134 663 and the number of general maternity visits was 2 334 688 being an increase of 200 000 on those of the previous year The annual report stated that when the Maternity Services (Scotland) Act came into force there would be a greater demand for nurses than had been the case in former years and the Scottish Council was doing its utmost to meet such demands It was hoped that work under this Act would be entrusted to the district nursing associations The new rates of pay would be £70 per annum rising to £95 or for those undertaking maternity nursing £75 rising to £100 with allowances for board and uniform

Honorary Physician to the King in Scotland

Among the six members of the medical profession engaged in public health work who have been officially appointed honorary physician to the King is Dr A S M MacGregor medical officer of health for Glasgow Dr MacGregor graduated M B Ch B at Glasgow in 1904, taking the M D degree in 1928 and the D P H of Cambridge in the following year He was for a time assistant physician in the Belvedere Fever Hospital house surgeon in the Western Infirmary and house physician in the Royal Infirmary of Glasgow Dr MacGregor has interested

The Medical Practitioner's Key Function

The general practitioner does not make his appearance in this story until the middle of the report, but he is declared to be the pivot around which the necessary reorientation of health services must take place The view of P E P is that diagnosis is itself the first and most important of specialisms and that the general practitioner should be recognized as a specialist in diagnosis First it has something to say about the economics of the profession It costs about £1,500 and takes five years' training to acquire a medical qualification In effect there is a stiff entrance fee to the profession, with the result that those with ability but no capital are lost to medicine Moreover, many doctors who have had to borrow to buy their practices have yet a further charge on their resources But once established in his profession the practitioner's income compares favourably with that of doctors in other countries and with that of other professions, save the law, in this

But the private practitioner is losing ground, and in the view of P E P measures to reverse this tendency are called for, partly from the health services as a whole, which should be 'tidied up' to enable the general practitioner to pass on for specialist treatment with the minimum of impediment those who require it, and partly from the special efforts of the general practitioner himself to reassert his position by adopting methods more closely in touch with common needs It is disturbing to find large numbers of general practitioners, after having been taught at great expense to use modern diagnostic equipment and to exercise judgement as between patient and specialist, launched out into a system which does not enable them to do their job properly

The very complexity of modern medicine makes it the key function of the general practitioner to ensure that the best use is made of the specialist services available to him It is pointed out that the patient who goes straight to the specialist, whether private or at hospital, is running the risk of wasting time and money, because the specialist can have no knowledge of his medical background and is trained to deal with only one group of diseases Yet modern developments have magnified the importance of the specialist, whose very name has a hypnotic attraction for the public, and his tendency to take over more and more of the work of the general practitioner has been increased by the creation of local authority clinics To some extent this development is essential, medicine being an ever-growing science and division of labour a necessary means of advance But it has encroached too far upon the province of the general practitioner, who has vital tasks to perform It is only the general practitioner, who is part of the health services himself but is also acquainted with the medical record and environment of the person requiring attention, who can intelligently and sympathetically determine the needs of the case

The Solitude of General Practice

For various reasons the general practitioner is rarely able, in existing circumstances, to fill the role marked out for him, still less to act as family health adviser He is too overburdened with routine work to exercise judgement, with the result that he is short circuited by one uncoordinated specialist agency after another The insurance practitioner, at any rate in large towns, often has neither the facilities nor the equipment necessary, and tends to become little more than an agency for signing certificates Further, instead of having his medical and intellectual interests stimulated by constant co-operation with members of his profession, as in hospital practice, he is too often isolated in his crowded surgery Yet again his training has been in the detection and cure of sickness Of individual preventive medicine there is little knowledge and even the rich patient who asks for a regular overhaul, comparable to the examination of his teeth by his dentist, must still be told that he is asking for the impossible Medical etiquette also handicaps the practitioner in doing constructive health work He cannot go to a potential patient, and the patient goes to him only when he is sick The old-fashioned family doctor who did a considerable amount of midwifery was able to give some general supervision to the health of the children, but nowadays the practitioner is often called in only in trouble, and then with scarcely disguised reluctance and lack of confidence, or, what is even worse, regarded as an oracle

The nation requires a large body of well educated and competent general practitioners, gaining a reasonable livelihood, and finding in their work interest and opportunity One thing which is needed is better organization of practices The suggestion is made that the position of such practitioners might be strengthened and public confidence in them fully restored if they had some scheme of working in local groups or well equipped central dispensaries, with the latest diagnostic and therapeutic equipment, and perhaps a small operating theatre and pathological laboratory The practitioner would thus be removed from his intellectual isolation and placed in surroundings where he could utilize the knowledge and experience of his fellow workers and give reciprocal help

The Gaps in National Health Insurance

One chief means for restoring the position of the general practitioner would be to bring dependants into national health insurance If this were done it might be practicable to set a limit to the extent of the private portion of the practice in relation to the insured, but the limit must, of course, be governed by the size of the capitation fee The extension to dependants would diminish the economic loss occasioned by ill-health At present a substantial part of such loss is incurred because the disease is not treated until an advanced stage, owing to the reluctance of the sick person to incur a doctor's fee, or to make use of the district medical service because of its association with public assistance, or to wait for hours in out-patient departments The working classes, saving on other insurances, should be able to carry the burden of half the cost amounting to 3d a week, the State carrying the other half, an annual contribution of £9 million

National health insurance is incomplete in other respects The insured often find their particular need either not covered by the scheme itself, or not covered by the society which they have joined, or covered only to a small extent Specialist services should be brought in, dental benefit extended to all the insured, and the national maternity service linked up with the insurance system so that the medical supervision of a pregnant or nursing woman would be in the hands of her own insurance practitioner At present the approved society organization causes obvious iniquities, and should be replaced by a structure more suited to contemporary needs

A large amount of space is devoted to a discussion of the place of the voluntary and the public (municipal) hospital The disadvantages of voluntaryism are mentioned, one being the large amount of time and energy devoted to "raising the wind" On the other hand, it is pointed out how frequently the public hospitals and public health services in general are handicapped by piecemeal and anomalous methods of organization which have no justification on health or administrative grounds One of the weaknesses of public hospitals is their dependence upon local government areas rarely corresponding with the most natural regions which the hospital, if untrammelled would serve

The complete merging of the two systems, if it comes about at all, will not be completed for a considerable time It should not be beyond the wit of man to devise some machinery to preserve the independence, originality, and boldness in experiment of the teaching hospitals while bringing them into a co ordinated system As for nursing

himself greatly in problems connected with epidemiology, and his contributions on this subject are well known His work has more recently been concerned with public health administration in Glasgow, and he was a member of the Departmental Committee on Health Services in Scotland

FRANCE

[From our Correspondent in Paris]

An International Study of Red Cross Health Activities

The newly created advisory committee of the League of Red Cross Societies met recently at its headquarters in Paris to discuss the future of Red Cross health activities in different parts of the world The Red Cross Societies of Great Britain the U.S.A., Germany, Austria, Colombia, France Guatemala, Italy Poland, Siam, Sweden, and Yugoslavia were represented at this meeting which was presided over by Dr Rene Sand, Senior Medical Officer of the Belgian Ministry of Health The British Red Cross was represented by Dr C Lillingston, and the American Red Cross by Surgeon General (retired) Hugh S Cumming The discussions were informal and no resolutions were adopted The subjects discussed were Red Cross action in connexion with rural hygiene, nutrition, mental hygiene, the health programme of the Junior Red Cross in the secondary schools, the health of the merchant seaman, and blood transfusion the last-named being a subject in which many national Red Cross societies are now interested It is hoped that the contacts established or renewed between the secretariat of the League and the experts in public health advising their respective national Red Cross societies will promote not standardization, but a certain continuity and cohesion of Red Cross health activities throughout the world

Who Owns X-Ray Negatives?

A recent discussion in the French medical press has revealed wide divergencies of opinion and practice with regard to the ownership and custody of x-ray negatives As a rule the French radiologist keeps his negatives but lets the patient have a copy or proof on paper wherewith to mystify himself In the course of this correspondence it was pointed out that the radiologist in the U.S.A not only keeps his negatives but is also chary of giving proofs to his patients, who have to satisfy themselves with an explanatory note Professor Laquerriere much prefers the American to the French system, and the only concession he would make with regard to the latter is in the case of industrial accidents when it may be advisable for one proof to be given to the injured person and another to his employer Professor Paul Boudin, the well-known medico-legal expert, has taken the line that the patient should own what he pays for to which reasoning Professor Laquerrière has replied with a *reductio ad absurdum* question, asking if the patient is entitled to claim the test tube in which his urine has been examined because, forsooth he has paid for the examination It seems to Professor Laquerrière as futile and risky to put *x*-ray negatives or photos into a patient's hands as to trust microscopical sections to him, for in either case the patient is likely to paw these delicate preparations to their undoing and his own interpretation of them may be as unwholesome as it is wide of the mark

A New Book on d'Arsonval

Dr Louis Chauvois has just published a book on d'Arsonval (Paris J Oliven 1937) The subject of this biography is till so much alive that although past 85 he has been known to drive his car several hundred kilometres a day with the light-heartedness of a 20-year-old Dr Chauvois's book is a happy combination of personal anecdotes and commentary on the development of the electrotherapy to which d'Arsonval has contributed so much One of the anecdotes concerns Claude Bernard's discovery of d'Arsonval in 1873 Claude Bernard was giving a demonstration of animal heat when the galvanometer on which he relied failed to work At the end of the demonstration an unknown medical student in the front row came to his rescue This was d'Arsonval's introduction to a most happy assistantship under his teacher When Brown-Sequard succeeded to Claude Bernard's chair he also took over the still young d'Arsonval as his assistant, and it was this phase of d'Arsonval's career that gave him a lasting interest in the problems of internal secretions In 1894 d'Arsonval succeeded Brown-Séquard, and he remained at the Collège de France until 1930 His best known contributions to medical science concern high-frequency treatment, and only those who have themselves pursued parallel studies can tell how much he has enriched every other field in which he has worked

"The First shall be Last"

What a fascinating collection of incidents and short stories could be made if a publisher were to group in one volume the *reminiscences of doctors invited to retail their* most dramatic experiences while "walking the hospitals" Dr J B Landau of Paris has given in *La Presse Médicale* for October 20 a good sample of what such a book should contain The year was 1905, the scene was the Maternity Department of Saint-Antoine, and the leading figure was the famous Dr Bar who, by the bed of a woman in travail, discussed the case with Dr Brindeau, his assistant Having carefully examined the enormous abdomen, Dr Bar addressed the class about him as follows 'I find a very large infant which does not, however, occupy the whole of the abdomen Though I can feel nothing behind this infant in spite of all my efforts to do so, this space can only be occupied by a second infant much smaller than the one I have just palpated Between the two placentas we shall find a one way communication benefiting the large and robbing the small infant But there is an inherent justice the large child the profiteer, satiated during intra-uterine life, will find it difficult to make his way after birth and to adapt himself The other, the puny one, will be less exacting and, better trained to fight, will come off victor' Dr Landau adds that subsequent events confirmed Dr Bar's prognostic flight of imagination

Dr Siredey Honoured

The amphitheatre of the Saint-Antoine Hospital was the scene a few Sundays ago of a touching ceremony at which a presentation was made to the octogenarian Dr Siredey formerly president of the Academy of Medicine and vice-president of the Association Générale des Médecins de France Returning thanks for the many speeches delivered in his honour, Dr Siredey dwelt on the shortcomings of life when old age has overtaken a man but he gave the lie to the rather tragic picture he had painted by the vivacity of his gestures and by his wit

The New Doyen of the Paris Faculty of Medicine

Professor Roussy has been nominated Rector of the University of Paris, and his functions as Doyen of the Paris Faculty of Medicine have devolved on Professor Tiffeneau, who has had a distinguished career as chemist and pharmacologist He was for some time a lecturer on chemistry at the Sorbonne Later he was appointed professor of pharmacology at the Paris Faculty of Medicine In 1927 he was elected a member of the French Academy of Medicine His contributions to pharmacology have been notable particularly in connexion with the relationships between chemical constitution and pharmacodynamic action

homes, which owe their existence to class and income distinctions, these will probably be replaced in the long run by the hospital paying ward One thing which they can best provide is accommodation for the chronic sick who are able to pay Nursing homes might be brought into closer association with local hospitals as satellite establishments

"Priorities" in the Health Problem

P E P considers it important to outgrow the practice of confining the term health services to what are really sickness services The nation needs sickness services, but if it regards them as a substitute for true health services it will find the confusion expensive in money and in suffering Many developments most vital to health are considered primarily from other standpoints

"The retailer who brings a more varied and higher grade diet or more suitable clothing and footwear within the reach of the masses of the population may well play quantitatively a more important part than the doctor in promoting general health The research worker is now generally accepted as a first rate contributor to health improvement but how many people recognize the apt journalist or public relations officer or film producer who can express essential health principles in simple form and get them adopted in practice as equally essential health workers?

The method of large scale advertising which has led the public and even the medical profession to favour and use proprietary health preparations to an extent far in excess of their real value and importance is deprecated. Indeed by the extravagant tone of commercial advertising and publicity a mass of uninformed customers are overpersuaded into purchasing many articles of food and drink which otherwise they would not think of purchasing and which on health grounds they would be better without. Reference is also made to the often unsatisfactory handling by the Press of health matters

Some calculations are made as to the annual cost of ill health, leaving out environmental services The "bill comes to £185 million, or one twenty-fifth of the national income In this total doctors and medicines including State and State insurance contributions as well as voluntary and private, account for £75 million On scientific research the State spends about £200 000 little more than one tenth of 1 per cent of the annual burden which medical research would help to reduce Much more research ought to be done, not only on the medical side but into the social and economic causes of ill health—for example strain in factories and ill-health caused by excessive journeys to work

With regard to physical education, the report states that at present we are turning out a population of "physical illiterates, unable to use their leisure in a constructive and healthy manner What we need is an educational system in which hygiene and physical education will not be subjects with a Cinderella status in the curriculum, but an essential and organic element in general education.

Finally, certain "priorities are named The first is with regard to nutrition a subject which occupies a great amount of space in the report, but of which only the skeleton recommendations can be given here These are

More effective measures to reduce costs of production and above all of distribution

Readjustment of national policies in order to secure free and unrestricted supply without any element of taxation of foods essential to nutrition

Propaganda and education to effect the necessary changes in national spending habits and diet

Subsidies to lower the prices of certain essential foods, or to bring specially cheap or free supplies to those shown to need more nutritious food and unable to afford it.

The second "priority is the provision of a general practitioner service for the dependants of insured persons The third is the allocation of a small sum of money for the encouragement of wider studies on causes of ill health and of independent study of the actual results and weaknesses of specific health services, national or local P E P urges that the task which it has attempted should be carried out as a continuous function of government

There should be men and women constantly tracing back into the factory the office the traffic system, and the home the origins of defects and diseases which are a burden on the nation There should also be in the universities and schools men and women evolving and conveying to the new generation an attitude of life based on healthy minds and bodies and prepared to face the implications instead of stopping short, as we still do at the stage of lip service

BRITISH RADIOLOGICAL CONGRESS

SYMPOSIUM ON INDUSTRIAL DISEASES

The eleventh annual congress arranged by the British Institute of Radiology was held at Westminster from December 8 to 10 The formal opening by the President of the Institute Dr Russell J Reynolds was attended by Queen Mary who also visited the exhibition of apparatus The two medical sessions over the first of which Sir Arthur MacNalty presided were symposia on radiology in the investigation of industrial diseases and in the physics session *x* ray research in industry was the subject

Silicosis among Pottery Workers

Several of the contributions related to silicosis Dr C L. SUTHERLAND of Sheffield said that the diagnosis of silicosis was a tripod one of the legs being the radiological examination a second the industrial history and the third the clinical history and examination and of these the most important was the first Nevertheless the classification of stages of the silicosis by the *x*-ray film should be avoided. Silicosis appeared to affect the upper part of the lung asbestosis the lower perhaps because the silica was a lighter particle He quoted the following passage from *The Citadel*

"There in the changing room the men stood before him stripped to the waist and with his fingers his stethoscope he plumbed uncannily the hidden pathology of those living lungs a fibroid spot here the next an emphysema then a chronic bronchitis Carefully he localized the lesions upon the diagrams printed on the back of every card

Dr Sutherland s verdict was that he could not have done it! The demonstration of silicosis was in the province of radiology

Dr J F BROWLEY of Birmingham described silicosis among pottery workers pointing out the special difficulties of the problem owing to the numerous processes concerned, the variety of the materials and the indomitable character of the Staffordshire workmen The harmful agent he believed to be the uncombined silicon dioxide dust in the form of flint English pottery was divided into two main classes china and earthenware, and although the Staffordshire potter was loath to sacrifice any of the fine qualities which had made his ware so justly famous he would benefit in health if the public could be satisfied with flint free earthenware particularly sanitary ware and forgo a certain beauty of appearance in their bathroom tilings

The same subject was considered by Dr KEMP HARPER of Stoke on-Trent In a survey of pottery workers all of whom had been employed for at least twenty years, silicosis was found in 35 per cent of the general earthenware workers in 38 per cent of the sanitary tile workers in 31 per cent. of the china workers, in 30 per cent of the china polishers and in 18.5 per cent of the flint middlemen The important factors were the intensity of silica in the dust the extent of exposure, the degree of cleanliness in working and the adequacy of ventilation

Correspondence

Treatment of Psychoneuroses

SIR,—If Dr E Fretson Skinner (*Journal* December 11, p 1196) is right the majority of practitioners will decline his suggestion that they should themselves treat those of their patients who suffer from neurosis According to him the psychological approach has no guideposts, and each patient will require about 100 hours' attention from the same doctor if he is to be treated properly If the first proposition is true not only will the practitioner not know how to begin but it is clear that no teacher will be able to instruct him The second proposition is true for every therapist who believes it to be so but not for others

If a doctor starts by letting a patient believe that his case will take about 100 interviews of one hour each then it will certainly not take less For many reasons most neurotics are not in a great hurry to be well and if the doctor says it will take 100 hours the patient will accept this and it happens accordingly Dr Skinner will probably scout the idea that he says anything of the kind to the patient but if there is one thing certain in psychotherapy it is that the doctor cannot help communicating his beliefs to the patient no matter how much he puts himself on guard

Now it is quite certain that there is an enormous number of these patients who are made well in a lasting way after a very few interviews which may be regarded as some proof of sufficient treatment I have published some examples where with quite short courses of treatment, patients with neurosis of many years standing and of by no means trivial degree have remained well for periods of from ten to thirteen years There are of course, patients who will require more than 100 hours They are not likely to be helped by the general practitioner, but they are not very difficult to recognize I have, however no doubt in saying that the majority of patients seen in practice, and most emphatically even in specialist practice do not need more than half a dozen psychotherapeutic interviews Dr Desmond Curran in a recent paper in the *Lancet* was so impressed with the ease with which many out patients got better after one or two interviews that he was inclined to think that the recoveries were spontaneous He was, of course undervaluing his own personality

Now about the tortuous approach without any guideposts For all these simple cases which form the bulk of Dr Skinner's 35 per cent of sick people quite visible paths have been made by many pioneers of whom Dubois of Berne and Dejerine of Paris may be mentioned I have myself, for nearly thirty years followed the roads they so clearly marked out and the results have been so striking that I have often wondered why all this pother about the difficulties of approaching the neurotic patient continues Their methods do entail a good deal of concentration on the part of the doctor but there are no other difficulties The method of Dejerine particularly will be found to synthesize what Dr Skinner regards as alternatives it combines suggestion re-education and an analysis of many unconscious factors it has the supreme advantage that it does not queer the pitch for any advance to deeper analysis By its employment many patients will be relieved of their illness and if in its simpler use it fails, one has nothing to contradict if one wishes to dig more deeply If this should become necessary, and if the case is likely to prove a long one, the avenue of approach has again been marked out by Freud himself and many of his followers especially Edward Glover Without endorsing all their conclusions it has seemed to me that these writers have indicated very clearly how to proceed—I am etc,

London W 1, Dec 11 T A ROSS

SIR,—It is certainly significant, and welcome that there should be correspondence on this topic simultaneously both in your columns and in those of the *Lancet* The whole question becomes more interesting and more challenging daily, as fresh evidence accumulates of the widespread incidence of these illnesses, and of the emotional causation of many bodily symptoms and syndromes One is reminded of the late Sir Walter Fletcher's wisecrack In fifty years time half of medicine will be dietetics and the other half will be psychological medicine

From all over the country there comes evidence of interest in the problem and perplexity about its solution Furthermore our profession which must ultimately solve the puzzle is being pressed on every hand by teachers, social agencies, magistrates clergy and others who are all of them confronted with individual problems or the social implications of this group of disorders How are these conditions best treated, and above all how are they to be prevented most effectively? How are the recommendations for changes in the medical curriculum being implemented and how are our needs for postgraduate training to be met? What plans can and should be made to provide the most adequate treatment for difficult cases in every part of the country? These are but a few of the questions which are constantly in the minds of many of us The whole matter is moreover urgent from a national point of view since presumably the slump that is foretold will bring economic insecurity which like the anxieties of war will lead to the breakdown of great numbers of persons who at present maintain a tolerably stable existence

We were told recently in the Press that the Ministry of Agriculture is going to spend a vast annual sum in the effort to eradicate animal diseases the Ministry of Health (is distinct from the Board of Control) seems hardly to be convinced that there *is* a problem to be solved in connexion with the psychoneuroses I believe that if the British Medical Association were to appoint a special committee representative of general medicine public health and psychiatry to investigate these questions as fully as possible and to make practical suggestions something effective would result We need a 'ten year plan' *to deal with this aspect of national unfitness* Approved societies local authorities magistrates and sociologists are all looking for such a lead but above all it will be welcomed by our own colleagues who carry the responsibility for the sick—I am, etc,

London W 1 Dec 13 J R REES

Early Diagnosis of Pulmonary Tuberculosis

SIR,—I was interested in the article on the early diagnosis of pulmonary tuberculosis (*Journal* December 4, p 1103) by Dr Geoffrey Marshall who stresses three methods of investigation (1) examination of the sputum (2) radiography of the chest and (3) recording the temperature In some cases obscure tachycardia may perhaps also form a suspicious sign

Just recently I saw a young man aged 21 complaining of neuritis of the left shoulder and arm When his condition

Dr J L Grout of Sheffield discussed silicosis among grinders, whose condition had impressed a poet of the eighteenth century

> So draws the grinder his laborious breath
> There, coughing at his deadly trade he bends"

Certain operations in dressing the stone were important factors in dust production The inhalation of the dust, consisting chiefly of silica, resulted in silicotic islets in the lungs. A peculiar grittiness was experienced in cutting through a silicotic lung, and this was due to the fibrous nodule which had formed as well as to the nidus of silica In more advanced cases these nodules coalesced He divided the radiographic appearances into three stages (1) discrete shadows indicating small nodules of fibrosis, (2) the whole of the lung field occupied by shadows with some coalescence to form more or less dense opacities, and (3) massive areas of consolidation

Other Dusts and Micro fungi

Dr J V Sparks of London brought forward the subject of asbestosis, which, he said, differed from other forms of pneumonoconiosis by the character and chemical composition of the particles inhaled The shape of the particles caused them to be arrested in the bronchioles rather than in the alveoli, and they were incapable of being readily transported into the lymphatic system Therefore pulmonary asbestosis gave a quite different pathological and radiological picture The symptoms of the disease—the cardinal one being dyspnoea, which in the late stages might be extreme—were much more pronounced than the physical signs or radiological appearances suggested Unfortunately it was impossible to recognize the disease radiologically in its early stages, and when the radiological evidence—fibrosis—was present it meant that the disease was advanced

An interesting contribution on particles of organic matter which tended to lodge in the lungs of agricultural workers was made by Dr R Fawcitt of Ulverston The matter in question was the micro-fungi in hay, straw, foliage, roots, and soil, also in the excreta of animals, rendering the worker liable to asthma, bronchitis, and pneumonia, frequently of a type which ran a protracted course In the United States the extent of micro-fungus infection was recognized by the appointment in some hospitals of a whole-time mycologist The essential points were the occupational history, the source and mode of infection, the clinical findings (dyspnoea being out of all proportion the chief symptom), the discovery of the fungi in the sputum, and the absence of tubercle bacilli on repeated examination As one who had devoted his leisure to the study of fungus Dr Fawcitt brought many interesting types before the meeting, in particular those which appeared in a cloud of dust when rotting hay was being handled It was a moot point whether workers who had had a mycotic infection should be allowed to enter a trade in which there was a risk of silicosis

Dr J F Brailsford of Birmingham said that practically all the radiographs used to illustrate the papers given during this congress were of workers dying of pulmonary fibrosis due to inhalation of dust The changes shown were definite and profuse, and admitted of no hesitation in recognition and diagnosis The extent and, to a large measure, the nature of the lesions in these cases could have been judged from a clinical examination, having the knowledge of the nature of the workers' employment While such an exhibition of destruction of human life showed an unfavourable aspect of modern industrial processes it did not materially contribute to preventive medicine He did not believe this to be the best use of radiology, which with more careful study permitted of the recognition of damage to lung tissue in apparently healthy workers, and by so doing indicated the danger of the work and the susceptibility of the workers, permitting of their removal from the injurious process before irrevocable damage had been caused

Respiratory Efficiency

Dr Esther Killick brought forward certain investigations which are taking place in the Department of Industrial Medicine, Birmingham University, with a view to correlating the tests of respiratory efficiency with radiological appearances in the lungs Tests were made for the vital capacity of the lungs, the ventilation equivalent for oxygen, the dead space, expressed as a percentage of total air, and the exercise tolerance test She showed tables giving the results of these tests in a few chosen individuals together with the radiographs, and pointed out some interesting correlations She hoped the tests would help to decide how much, if any, pulmonary damage resulted from exposure to dusts which had been regarded as comparatively harmless

A radiological study of excretion of dust from the lungs was presented by Dr A E Barclay He drew attention to the powerful but delicately balanced action of the cilia, covered with a blanket of mucus, in such excretion Ciliary action was indeed the only normal method of excretion from the bronchi and bronchioles, for coughing must be regarded as pathological In his experiments cats had been used because of their large trachea Dust, in the shape of fine particles of bismuth carbonate and also of powdered lead glass, was insufflated into the lungs of these animals, and the process of excretion watched under the *x* ray screen, the cat being anaesthetized and a tube passed down the trachea with the laryngoscope These experiments were not comparable to those relating to dust in industry, the quantities passed into the cat's lung being infinitely greater than it would be possible to inhale But the lungs were shown to be capable of excreting these large quantities, and even the powdered lead glass dust was excreted as strongly and effectively as the other The glass dust was insufflated into a number of cats on more than one occasion—twice in four, and three times in two—and always the excretion was just the same as at the first, and the cat was none the worse afterwards On the other hand, if the dust was wet it was carried right down into the alveoli, where it was extremely difficult for the lung to get rid of it There appeared to be a defence mechanism against dry dusts at the entrance to the alveoli.

Wide-field X-Ray Therapy

The eighteenth Mackenzie Davidson Memorial Lecture was delivered during the congress, the lecturer being Dr S Gilbert Scott and his subject wide-field *x*-ray therapy Dr Scott said that in *x*-ray work very small radiation fields had generally been used, and as apparatus became more powerful the field became smaller still Two things were hindering progress first, that deep therapy was considered the only method of applying *x* rays, and, secondly, that cancer was the only condition which *x* rays could treat But cancer was relatively a rare disease, while the benign conditions which *x* rays could treat were legion His own interest in wide field work had been aroused many years ago by experiments on guinea-pigs in which the whole body was exposed to *x* rays—in other words, these animals received an *x* ray bath It was found that if a heavy dose were given to the animal a subsequently grafted tumour took readily, but with a lighter dose the graft would not take, and with very light doses the animals thrived

In comparing deep *x* ray therapy with the wide field method, he said that the latter employed a low instead of a high kilovoltage, long or medium rays instead of short, medium instead of high penetration, light instead of heavy filtration, a large field instead of a small, and a small dose instead of a large The maximum skin dose given with deep *x* ray therapy was about 600 *r* units, but in wide-field therapy it was only 60 to 100 units The effects, instead of being local, were general and constitutional The patient, not the growth or other local condi-

did not respond to ordinary treatment he was sent to an orthopaedic hospital for further investigation X rays revealed nothing in the shoulder region but some suggestive lesions in his lung apices On examination of his chest no physical signs could be made out even by the tuberculosis medical officer and there was no sputum to examine As the patient was a glass blower he was advised to change to an open air occupation About three or four weeks later he developed a haemoptysis with some expectoration which then showed some tubercle bacilli in it Even now the only physical sign is his shallow respiration

This case shows how important it is to have radiographs taken in cases in which there is any suspicion of tuberculosis —I am, etc,

Surbiton, Surrey Dec 5 L B SHELTON

Atelectasis and Bronchiectasis

SIR,—I was interested to read Dr F G Chandler's comments in the *Journal* of December 4 (p 1141) on my article on atelectasis and bronchiectasis (November 13, p 963) The temporary and physiological bronchial dilatation such as I described should *for reasons of treatment* be kept in a separate group and this point I emphasized at the end of my article Cases of atelectasis with bronchial dilatation have been submitted to what is often an unnecessary, and sometimes a fatal, lobectomy While emphasizing the temporary nature of the condition I purposely used the term 'bronchiectasis to catch the attention of those who recommend these premature operations If there were any practical value in Dr Chandler's wish to change this term I think he would agree that it would be difficult to do so satisfactorily If we do not wish to use the term "bronchiectasis" for some forms of dilatation it is necessary to give a clear definition of what 'bronchiectasis" really does mean, and this as is very evident in Dr Chandler's letter, is no easy matter It may be difficult even after long observation to make a clear separation between the temporary and permanent conditions on clinical and radiological evidence The lobe may remain collapsed for months and then may re expand Infection may be present, and there is usually nothing in the radiograph to indicate whether the atelectatic lobe will re-expand and persistent bronchiectasis be avoided The real difficulty lies in determining when the bronchial dilatation becomes irreversible, and in making this decision naturally pathological aid cannot be sought

The distinction can only be made by allowing adequate time and treatment for re expansion of the lobe If it fails to re expand, the bronchi, as in other forms of bronchiectasis, whether wet or dry, may develop a persistent heavy infection, and surgical intervention may become necessary Before treatment to promote re-expansion has failed, any attempt to distinguish the condition of the bronchi by the giving of names would merit Dr Chandler's scorn as a 'classifying of flowers by their colours Is it not simpler and less self-deceptive to keep the one term 'bronchiectasis for all bronchial dilatations and to remember that in atelectatic lobes this condition may be temporary?—I am, etc,

G H JENNINGS

British Postgraduate Medical School, Dec 6

Research on Rheumatism

SIR—I must at once thank Sir Leonard Hill for his amiable approval of my attempts It is only right and in justice to others that I should state that from the first and throughout I was and have been assisted by well-known investigators in this country, the Dominions America, and on the Continent Only experience and the younger generations will prove whether a completely specialist unit is the best for such a subject as 'rheumatisms —I am, etc,

Bath, Dec 8 F JOHN POYNTON

"Cures" in Rheumatic Disease

SIR—Mr Timbrell Fisher's letter (*Journal* November 27, p 1094) is very opportune His remarks are particularly applicable to most of the-so-called clinics devoted to physiotherapy I would like the opportunity of calling attention to the system which has been adopted at the Institute of Ray Therapy, from its inception, in reference to the classification of discharged patients The term "cured" is not employed at all In its place the term "fit" is used, and that applies to those patients who have been free from symptoms for at least a month and who are either considered fit to return to work or who have already returned to work without any recurrence of the symptoms Although no very extensive follow-up system has been adopted, there is no record of any patients discharged as fit having come back for treatment

Cases that cannot come under this heading are discharged as improved ' only when the condition has so materially improved as to justify the assumption that no further improvement can be expected Where patients show little or no sign of improvement they are discharged as "no improvement"

I would like to add my support to Mr Fisher's plea that the misleading term 'cured' should be abolished No one can say a case is cured unless there has been no relapse over a period of years and a very close follow-up has been instituted —I am, etc,

London W 1, Dec 9 WILLIAM BEAUMONT

SIR—Mr A G Timbrell Fisher (*Journal* November 27, p 1094) writes in reference to the use of the term cure ' in spa advertisements, and to its application to such notoriously intractable conditions as the chronic rheumatic diseases Dr G L Kerr Pringle (December 11, p 1198) in a very reasonable reply concludes that the term cure ' is comprehensive and concise, and free from objection when correctly used He quotes the definition, a particular method or course of treatment directed towards the recovery of the patient" This definition, I consider, has in the past been more or less accepted, but times change, and I feel that at present there are many members of the medical profession, and also of the public, who do not use the term in the above sense or understand it to mean "care ' or "a particular method or course of treatment,' but would define it as 'treatment which does away with disease and restores health"

Mr Timbrell Fisher regrets that advertisements emanating from lay authorities publicity departments make use of the word cure in a reckless manner, and rightly assumes that medical men at spas and elsewhere view such advertisements with grave concern Dr Kerr Pringle also objects to these extravagant advertisements

I have previously stressed the point that advertisements which deal with health matters and the therapeutic indications of spas and health resorts must be accurate, and that such advertisements should only be issued by publicity departments when they have been censored and approved by the medical officer of health and by local medical committees If such a procedure were adopted it would not be possible to receive the following advertisement, which has just come through the post ——— Spa will Cure your Rheumatism The use of the word "cure"

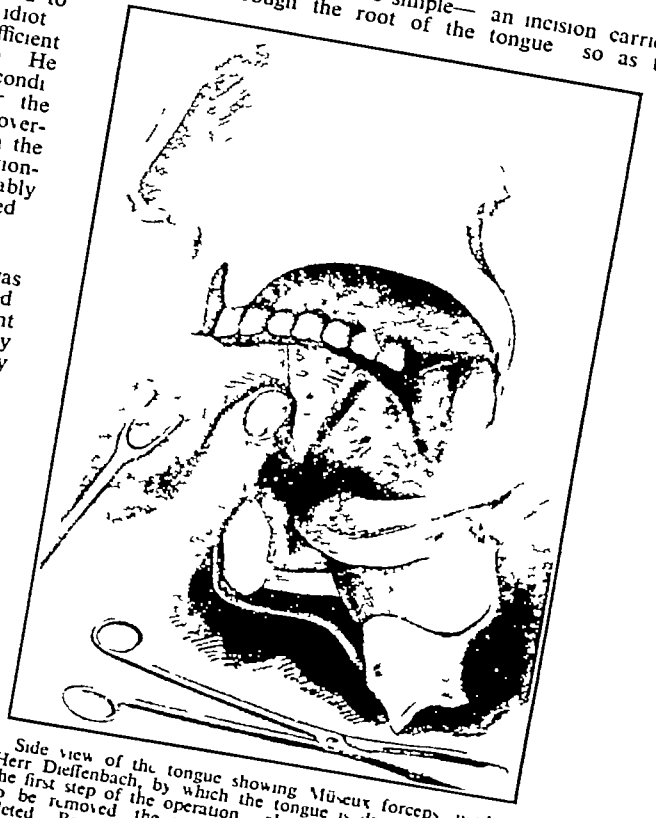
tion, was treated In deep therapy all attention was concentrated upon the growth the patient was almost regarded as something attached to a tumour! The speaker added that in his technique he originally used two tubes one behind and one in front of the patient but now he employed a wide angle metalix tube which gave a dose widely over the trunk at the optimum distance—seventeen inches—from the patient

After such mild and wide field treatment by x rays some people felt better immediately some felt depressed and suffered from headache Distortions of taste and smell were not uncommon and one patient said that his hearing was so acute for two hours after the bath that he could even hear the watch ticking in another man's pocket Salivation and intense hunger were sometimes induced and frequency of micturition occurred Asthma was the first condition treated the value of the treatment being discovered accidentally In purely allergic asthma relief could be confidently predicted in the infective type of asthma many cases were relieved in a mixture of the allergic and infective types the results were poor Satisfactory results were obtained in migraine but here as in all cases the rays were not directed at the seat of local trouble, the condition was treated as a constitutional disease Good results appeared in the chronic infective rheumatic group He had even noticed an improvement in the condition of mental defectives submitted to the treatment for various conditions A village idiot who had been treated for asthma became a very efficient domestic servant and a dullard won a scholarship He stressed the point that an enlarged gland or other condition was not treated directly but benefited under the general stimulus that care must be taken not to oversaturate the patient, and that it was better to err on the side of underdosing It seemed to him that the functioning of the ductless gland system was affected favourably and the natural defensive powers of the body reinforced

Exhibition of Apparatus

In association with the congress an exhibition was arranged to which twenty commercial firms contributed One of the novelties was an entirely new instrument called the "telecord" an arrangement whereby the x ray exposure is synchronized with the cardiac cycle thereby securing a greatly reduced exposure time for chest radiographs There was also a historical and scientific section which included a number of Crookes's tubes and other apparatus dating from 1896 also some bromide prints of radiographs of the same period As examples of modern work Dr Russell Reynolds showed his x ray cinematograph apparatus from the physics department of St Bartholomew's Hospital came an exhibit illustrating the effect of radiations on liquids and gels from the Royal Cancer Hospital an apparatus for the investigation of the quality of radiation inside a scattering material, and from the Strangeways Research Laboratories some examples of gamma radiation on growing tissues Other exhibitors were the National Physical Laboratory the physics department of the London County Council the University of Reading, and a number of individual research workers.

D Jorda (*Vestnik Chirurgii* 1937 **53** 139 3) describes briefly the organization of the blood transfusion service of the Spanish Republican Army The headquarters of the service at Barcelona has at its disposal 2,300 donors belonging to the different blood groups Citrated blood which has been properly tested for sterility is sent to the front in special glass containers in vans fitted with refrigerators Since October 1936 350 litres of blood have been used The same organization also supplies the standard sera for group testing and blood plasma for intramuscular and intravenous injections The author also describes the technique of the collection and the conservation of the blood and the apparatus used for the transfusion



Nova et Vetera

PARTIAL GLOSSECTOMY AS A CURE OF STUTTERING

In 1841 a small book was published in London entitled *Memoir on the Radical Cure of Stuttering by a Surgical Operation* by J F Dieffenbach translated from the German by Joseph Travers, late house surgeon to St Bartholomew's Hospital The translator in a preface writes "In the following memoir M Dieffenbach has laid before the world another proof of his genius as an operative surgeon Time alone can show how far this operation may be generally applicable but the success of the first sixteen cases and the very small proportion of untoward circumstances attending them, hold out the fairest prospect of its coming speedily into general use

Dieffenbach's Operation

This operation was quite simple— an incision carried completely through the root of the tongue so as to

Side view of the tongue showing Müseux forceps used by Herr Dieffenbach, by which the tongue is drawn forwards in the first step of the operation also the wedge shaped portion to be removed the posterior or first incision already completed Beneath is another form of Müseux forceps

produce an alteration in the condition of its nervous influence allaying the spasm of the chordae vocales etc Actually three methods were tried "(1) the transverse horizontal division of the root of the tongue (2) the subcutaneous transverse division in which the mucous covering of the tongue is left inviolate and (3) the horizontal division with excision of a wedge shaped portion The author is more sanguine as to the success of the latter method than of the two preceding ones as here some shortening of the tongue must necessarily ensue

in this sentence surely means that the waters and treatment at that spa, in the words of the above definition, do away with rheumatism and restore health—I am etc

Torquay, Dec 11 K R Collis Hallowes

Medical Climatology and Hydrology

Sir,—The space which you so generously gave the Bath Conference of the British Health Resorts Association encourages me to ask you to allow me to develop a point I raised in one of the discussions

This association which began as a patriotic effort to encourage our health resorts to justify the medical profession in urging patients to seek health at home has gradually increased its scope Having the support of the two Royal Colleges the B M A and the Society of Medical Officers of Health its strong Medical Advisory Committee has naturally been led to consider the more technical medical affairs connected with these resorts

The value of climate and waters in the treatment of various forms of ill health has been recognized from time immemorial but much of their reputation still rests on empirical grounds That is no reflection on their value but we as a profession would much prefer to base it on more scientific grounds This will not be done until the subjects of medical climatology and hydrology are dealt with in the medical curriculum—either ante or post graduation We find that in nearly every Continental country encouragement is given to this study by the Governments and by the educational authorities but so far nothing has been done here Our approaches to these authorities have been met with the answer that there is no demand for such education or for a diploma recognizing that such training has been given And the Government which used the spas with great effect during the war, has since practically ignored their existence

I hate to think that this country is behind any other in anything of real value to its citizens but it is difficult to believe that we who do nothing are right while all the other countries which recognize the value of training in medical climatology and hydrology are wrong The demonstrations we saw at Bath and elsewhere have greatly impressed us with the excellent work that is being done the value of which we feel is far from being as much recognized as it ought to be

I write this letter in the hope that it may lead other people to ask why it is that Great Britain is almost the only country in which State recognition and encouragement have not been given to a form of treatment universally acknowledged to be beneficial and why our educational authorities have so far done nothing to train and earmark the practitioners who are working or wish to work in this specialized field—I am etc

Alfred Cox
General Secretary British Health Resorts Association

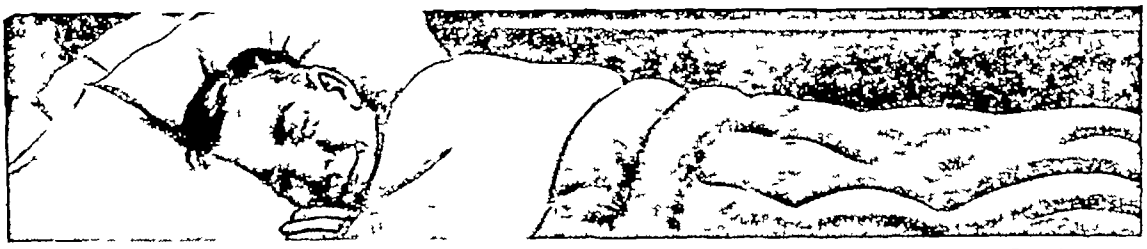
London W 1 Dec 13

Spa Treatment of Rheumatism

Sir,—The report in the *Journal* of the health resorts conference at Bath showed that there was a distinct difference of opinion amongst spa specialist physicians as to the value of hydrology in cases of rheumatoid arthritis This illustrates the difficulty of treating this disease A large number of rheumatic cases are treated at home nowadays this is not surprising owing to the increased knowledge of the diseases in question and the therapeutic measures available amongst medical practitioners The difficulty, however is diagnosis and even the specialist is sometimes doubtful as to whether a case is purely rheumatoid arthritis, rheumatoid arthritis plus gout or gout plus gonorrhoeal arthritis Medical diagnosis and treatment is becoming more and more specialized Hospitals solely for the treatment of rheumatic diseases at, for example, Bath Buxton and Harrogate enable their staffs to acquire a knowledge of these diseases which is available to all—I am, etc,

Bath Dec 13 A Gordon Watson

Trichinosis



Sir—In his paper on subclinical trichinosis (*Journal* December 11 p 1162) Mr V D van Someren says The above constitutes all the published records of trichinosis in the British Isles which it has been possible to trace I have a distinct recollection of an outbreak among the boys on the training ship *Worcester* It was at first thought to be enteric fever Mr Power who was then principal medical officer of the Local Government Board investigated the matter and reported that it was trichinosis The date must have been about 1880 and one would think a record could be traced I remember too that the episode prompted *Punch* to produce some amusing verses about a cottager who owned a few pigs Fearing they might be infected he killed one of them and sent a present of pork to the vicar of the parish warning his wife to watch the effects at the vicarage before eating any of that pork—I am, etc.,

Camberley Dec 13 S W Sutton M D

Spinal Anaesthesia

Sir—I have followed with great interest the articles and correspondence on the question of spinal anaesthesia We have used this form of anaesthesia as a routine for every operation below the diaphragm for some six years or more In 1936 we administered it on 173 occasions for such varied procedures as gastro-enterostomy nephrectomy appendicectomy Caesarean section prostatectomy amputations and excisions of joints in the lower limb, and even sometimes for the application of forceps Throughout this period we have used a drug that I have never seen mentioned in the pages of the *Journal*—namely tropacocaine We use the 5 per cent preparation put up by Merck in 1 c cm ampoules

As Chinese patients are notoriously good surgical risks and rarely nervous premedication is not the rule though some patients are given 1/4 grain of morphine just before coming to the theatre For fistula in ano or lower limb operations the needle is inserted at the fourth lumbar space and immediately cerebrospinal fluid is obtained we inject, without withdrawal of fluid 1 c cm For abdominal operations the third space is entered and 2 c cm injected The patient s head is then lowered with a view to preventing any unpleasantness due to a fall in the cerebral circulatory pressure I must confess however that we have never once observed the blood pressure having previously satisfied ourselves from the practice of others that this is unnecessary Generally there is a smooth sequence of operative events Occasional nausea or subjective shortness of breath is overcome by advice to breathe deeply or by an injection of ephedrine hydrochloride Satisfactory anaesthesia usually lasts from one to two hours or even longer depending on the quantity of tropacocaine injected If towards the end of a long operation any complaint is made local infiltration with

EASE OF BREATHING ENSURES A RESTFUL NIGHT

A pleasant and beneficial night's rest is assured when 'Endrine' is used immediately before retiring It ensures easy breathing by quickly relieving nasal catarrh 'Endrine,' with its carefully selected and well-balanced ingredients, acts as a mild astringent and so, by reducing nasal congestion, promotes sinus drainage and improved breathing

THYMINIC ACID BASE

URALYSOL

TRADE MARK

FORMULA

Thyminic Acid	0·10
Hexamethylenetetramine Anhydromethylenecitrate	0 50
Hexamethylene Tetramine	2 50
Piperazine Tartrate	0 25
Lithium Carbonate	1·00
Sodium Benzoate	1 00
Effervescent Base	ad 100

DIRECTIONS

One teaspoonful to be taken morning and night in a tumblerful of water

Uralysol, in addition to being a solvent and eliminator of pathological Uric Acid is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists general metabolism and after it has played its part is eliminated together with the normal thyminic acid of the organism When however, uric acid is present in excess the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid

Uralysol, by its thyminic acid content, supplies the agent necessary to dissolve excessive uric acid

The next step is the elimination of this thyminic uric acid which being in excess of normal, necessitates treatment by an agent capable of enhancing elimination

Uralysol, by its content of hexamethylenetetramine and lysidin, stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

Samples and literature on request.

CONTINENTAL LABORATORIES LTD. 30 MARSHAM STREET, LONDON, S W 1

novocain will almost invariably allow a painless closure Supplementary general anaesthesia is a rarity

Throughout the six years in question only one death could be in any way attributed to the spinal anaesthesia —in a much exsanguinated and moribund patient, with a ruptured extra-uterine pregnancy, who died before the incision could be made This was early in the series, when blood transfusion was impossible and the newer continuous intravenous saline administration was not in use The only serious complications traceable to the spinal anaesthetic were also early in the series, and may have been due to faulty technique These were three cases of painless sloughing of an area of skin on the calf In each instance this was preceded by a blister like that due to a burn from a hot water bottle The latter possibility, needless to say, was carefully exluded

Post anaesthetic headache is rare and always temporary This is I feel due to the fact that only a drop or two of cerebrospinal fluid is permitted to escape, and also to the small volume of anaesthetic solution injected

This method which is in general use in many hospitals here, has proved so valuable to myself and others that we have not thought it worth while to try any other — I am, etc,

Spinal Anaesthesia for Caesarean Section

SIR —May I contribute to this discussion a suggestion that is, I believe, in accordance with the facts of anatomy and physiology? A pregnant woman differs from a normal patient in that her 'splanchnic area' is enormously enlarged, and both the number and the calibre of the blood vessels, the tonus of which is abolished by spinal anaesthesia, are much greater at the end of pregnancy than at any other time The marked fall in blood pressure following the administration of a spinal anaesthetic, which in a normal patient is noticed only after paralysis of the mid-dorsal nerves—that is, in upper abdominal anaesthesia—will in a pregnant woman manifest itself as soon as the upper two lumbar roots are affected, these latter conveying the vasoconstrictor fibres to the enlarged pelvic viscera This, no doubt, is the explanation of the "rachi-sensitivity" referred to by Mr G A Bagot Walters (*Journal* November 13, p 995)

The reported fatalities during Caesarean section have occurred shortly after the spinal injection, and it would appear that these patients have bled to death into the vessels of their own greatly enlarged "splanchnic pool" It is interesting in this connexion to note that among your correspondents who affirm the safety of a Caesarean section under spinal anaesthesia are those who advocate the use of ephedrine (Dr H K Ashworth, October 2, p 671, and Dr Katharine Lloyd Williams, October 23, p 826) Ephedrine is a drug which prevents a fall of blood pressure by virtue of its peripheral action upon the paralysed splanchnic vessels, and acts to its best advantage in late pregnancy when the splanchnic area is at its maximum One would like to learn whether those who have reported fatalities have overlooked the value of ephedrine under such conditions, or have employed the drug without allowing a full thirty minutes for its action to take effect I submit this as a possible explanation of the marked differences not only of opinion but also in clinical experience expressed in your columns, although the successful series of cases at Cairo reported by Dr R B Coleman (October 23 p 826), between 1915 and 1927, before the use of ephedrine became general, weighs against an explanation on these lines It would, I fear, be uncharitable to Dr Coleman and his surgical team to suggest that these patients may have fortified themselves with their own adrenaline!—I am, etc,

Fractures of the Scaphoid

SIR —I was very interested in Mr Salisbury Woods's account of the union of the carpal scaphoid after six weeks' delay in treatment (*Journal* December 4, p 1119)

The diagram in his report shows that the site of fracture was through the middle of the navicular bone, a position unfavourable to an effective blood supply to the fragments Lorenz Bohler has shown that the normal blood supply to the navicular is by way of two main arteries, one entering by the tuberosity and the other at the middle of the bone This is important, as a fracture of the tuberosity, being extra-articular and having a good blood supply, will heal with any or no treatment at all, a fracture distal to the middle of the bone will heal well if properly immobilized, but a fracture through the middle or proximal part, when treatment is delayed, will need long and uninterrupted fixation, since these last fractures either destroy the main artery or at least cut off the blood supply of the proximal fragment

Mr Salisbury Woods does not mention whether the first *x*-ray examination showed any cavitation of the fragments An abnormal blood supply to the bone in his case is indicated, first, by the absence of traumatic cavitation, and, secondly, by the rapid subsequent union I stress this point because it is only the exceptional case which will unite so rapidly, the majority needing from four to six months fixation unless hastened by drilling the bone An important point causing delay in treatment is that in a radiograph taken immediately after the accident the fracture may be very difficult to see, even if one is looking for it, while a few weeks later, as the fracture gap widens, it is obvious

In my limited experience of these cases I have found that when the fracture of the navicular is the only injury the patient often treats it as a sprain and comes late for treatment, but when it accompanies a Colles's fracture, as it often does, the break is not easy to see in the radiograph, and may be overlooked until later, when it becomes apparent Time, however, has by then been lost and disability prolonged —I am, etc.,

Evesham, Dec 5 G HARVIE DUNCAN F R C S.Ed

Applying for Hospital Posts

SIR —I would like to give my strong support to the letter appearing above the initials "F R C S" in the *Journal* of December 11 (p 1200) Most of us have vivid memories of that difficult time in our life when we were trying to obtain a footing on some honorary staff Why should it be necessary for hard-up aspirants to spend their money on a beautiful printed form of application when the typewriter can do all that is necessary for one-twentieth of the cost? Why, also, should election committees waste their time in listening to the well known testimonial that conveys very little real information concerning the merits of the candidate? Personally I pay no attention to testimonials, but generally tell those who call upon me that a personal letter from those who know

exist to cover them But we do not think that the allowances are adequate The proportion of rent rates, etc, allowable must cover the garage and that portion of the establishment used privately by the assistant as well as the surgery and waiting room We should have thought that two thirds would have been allowed though the difference between that and three fifths is not substantial To reckon wages and not board seems a clumsy way of estimating the professional element in the expense of the staff The proper basis would seem to be to treat as allowable a high proportion of the cost of the maid—say four fifths—one half the cost of the gardener chauffeur and, say, one half of the cost of the cook—she is employed purely in working for the indoor assistant and the other two members of the staff and to that extent is employed professionally These suggestions, however are of course made without any knowledge of the particular circumstances and such ratios naturally vary according to the facts of each case

Partial Residence Abroad

"SOY asks in what circumstances any special relief can be claimed by one who is obliged to live abroad three quarters of each year owing to ill health The income is derived from the United Kingdom

*** Assuming that Soy has recently been a resident of this country subsequent absence would not give any relief, at least while he returns periodically to the United Kingdom. If on the other hand he has been residing in, for example, India and has then adopted the habit of life mentioned he would not have to prove the cessation of United Kingdom residence But even then it would be of no benefit as regards income derived from this country, unless it were interest on one of the Government issues to which the special exemption of non residents applies

Cost of Dispenser Secretary

'M B' employs a dispenser secretary he pays her £156 per annum and supplies her and her 18 year old daughter with board and lodging, considered to be worth at least £156 per annum. The inspector of taxes objects to the allowance of £312 as a professional expense on the ground that the amount is excessive

*** From the list of duties supplied it appears to be clear that the employee's services are varied—for example, she drives the car—and would justify remuneration above the ordinary dispenser scale It is however, mentioned that she supervises my household and of course in so far as that extends to non professional work—for example, house keeping—the remuneration would have to be regarded as partly of a private nature On the whole, some figure between the £156 hitherto allowed and the £312 now claimed would probably be a reasonable compromise We suggest that the question could best be discussed personally with the inspector with a view to compromising the claim at, say £225 or £250

LETTERS, NOTES, ETC.

Drug Treatment of Typhoid

Dr G L L LAWSON (Rooty Hill N S W) writes Forty-eight years ago I had to deal with a severe epidemic of typhoid in New South Wales Dr Ashburton Thompson the medical officer of health for New South Wales, suggested to me that since typhoid was due to a micro-organism a germicide should be useful in treatment. It was agreed to use blue ointment and about 10 or 20 grains were rubbed into the right groin one day, the left groin on the second day and over lower abdomen on the third day and continued in this rotation At the same time a mixture containing about 1/20 grain of iodine was given two or three times a day A prescription appearing in a medical journal a few months previously formed the basis of this prescription The fore going gave very satisfactory results About this time I read Dr Illingsworth's little book and I decided to change to iodide of mercury I prescribed liq hydrarg. perchlor 1½ oz. potass iodidē grains 24 to 48 spt chlorof 48 minims and aq menthæ pip to 12 oz 1 oz. to be taken every four hours in plenty of water for four doses daily The amount of potassium iodide and the size and frequency of the dose were varied to suit the condition of the patient Tinct nuc vom 5 to 10 minims was added to each dose as required and was given on the first sign of tremulousness. Tinct. opii 2 to 4 minims or mist. cret. with aromatics was added if there was marked diarrhoea The injunction was better than the liquid The illness lasted about one month, and after the temperature had subsided the medicine was continued for fourteen days, otherwise the temperature rose again The diet was soft and varied in the later stages, well-cooked porridge and even a glass of beer being allowed daily After ten to fourteen days the potassium iodide was usually changed to sodium iodide If called upon to treat another case I would use the injunction and would give internally hydrarg cum cret grain 1/4 pulv pro mist. cret grains 4 sacch. lact grains 10 pulv amyli q s the whole to be well triturated together and given every four hours if awake To be varied with hyd iodid virid 1/32 grain in tablet form well diluted every hour for five or six doses then every two hours or three hours.

Wireless Consultations

Dr PHILIP SIMON (Cardiff) writes For the past fifteen months I have been surgeon on a liner travelling between England and South America On ten occasions I have received wireless calls for medical aid from cargo ships—nine English and one foreign—none of course, having a doctor on board Some minor cases were treated to a successful conclusion the more serious until the ships passed out of range On the return of these ships to their home ports might I not have expected from the owners a notification of what had happened to the patient? Such an act of common courtesy, at least, would appear to be due to the profession A word of thanks, too might justifiably have replaced the complete absence of information which I have been accorded

Magsorbent

Kaylene Limited announce that the retail selling price of magsorbent powder is to be reduced by 40 per cent on December 1 This reduction in price applies both to the United Kingdom and to the Irish Free State Magsorbent is a synthetic hydrated magnesium trisilicate which has been used for the treatment of peptic ulcer, hyperchlorhydria, and acid dyspepsia

Opportunities for Women Medical Students

Dr J MCNAMARA (Kensington W) writes Your article (December 4 p 1124) dealing with the difficulties encountered by women trying to enter the medical profession is painful reading Why should women be so treated and where is our sense of fair play? From the days of the gallant struggle by Dr Sophia Jex Blake and Mrs Garrett Anderson to our own time the attitude of many leaders of the medical profession in this matter has been deplorable

Diaries and Calendars for 1938

We have received from Messrs Frederick Aldridge (34 Paternoster Row London E.C 4) a copy of their *Hospital Diary* for 1938, compiled by Mr F P Carroll In addition to the diary proper—which this year has a cellophaned thumb-index—there is a section of special interest to hospital officers and those engaged in hospital administration it includes notes on hospital law by Mr Clement Cobbold M A, Secretary of the Royal Cancer Hospital There is also an alphabetically arranged guide to hospital suppliers The price of the diary bound in leather cloth, gold blocked, is 5s 6d post free

Messrs John Walker and Co Ltd (5 and 6, Warwick Lane London E C 4) have sent us a selection of diaries and calendars for 1938 The latter are printed in the bold and clear type for which Walker calendars are noted and the diaries are attractively bound in leather covers of various colours and are obtainable in many different sizes to fit all pockets The prices range from 1s upwards

Christmas Fare is full of useful instructions on preparing, cooking and serving a Christmas dinner at home and includes a Cook's Time table for Christmas Day Copies can be had free from the British Commercial Gas Association 1, Grosvenor Place, S W 1, or from local gas showrooms

Messrs Cadburys have sent us in good time for Christmas an acceptable package of chocolates cocoa and Bourn Vita from their factory at Bournville whose reputation for enlightened management is known to every reader

their work will carry some weight I also agree with F R C S' that much valuable time would be saved not only for the applicants but for the members of the honorary staff, by a preliminary weeding out of all unsuitable candidates before the actual calling begins This is usually done in the case of applicants for house appointments It might also be carried out by an election sub committee in the case of appointments to the honorary staff—I am, etc

London Dec 10 KENNETH WALKER

Traumatic Perirenal Haematoma

SIR—Mr Hamilton Bailey has some interesting remarks on this condition in his book *Emergency Surgery* (p 343) I wonder what his advice would have been however, in the following case

A girl aged 10 stumbled backwards while carrying a bucket of water which fell on to her abdomen She complained of pain and a swelling became visible shortly afterwards apparently arising from the left iliac fossa She was brought to me five weeks after the accident and by this time the swelling had increased enormously She was very ill was in considerable pain and fever had been present for a week Haematuria was denied but numerous red cells were present in the urine On examination she was obviously in much pain and lay with the left hip flexed The swelling was the size of a football and caused a tense prominent bulging in the left flank occupying also the loin and extending to the iliac fossa A tentative diagnosis of infected hæmatoma following a ruptured kidney was made and operation was embarked upon after twenty four hours preparation Incision was made over the tense part of the swelling in the flank and the haematoma exposed Its wall was extremely thin and an attempt to increase the exposure caused a sudden cascade of bright arterial blood under intense pressure about two pints of blood were lost in as many seconds Respiration immediately became sighing. *The cavity and rent were rapidly plugged* with gauze and the patient was removed to the ward where she died after ten minutes

In this case the haematoma was so large that exposure of the renal pedicle or of the rupture was impossible and it is difficult to see how the fatal issue could have been avoided—I am, etc,

N Nigeria Nov 11 A L CRADDOCK

West London Post-Graduate College

SIR,—Dr Maurice Shaw's statement as dean of the West London Post Graduate College in the *Journal* of December 4 (p 1144) will not be agreeable reading to a very large number of graduates That lady students should have better opportunities than so far afforded them for clinical study is admitted by all, but why choose the West London Hospital which has been responsible for postgraduate teaching for men from different parts of the United Kingdom and every British Colony? The change is already being felt, but when the West London finally closes its doors to graduates it will be a sad and hard day for qualified men who come on study leave from the Dominions and Colonies The college gives extremely good value and is very well run Save midwifery, every branch of medicine and surgery including gynaecology, is taught and taught well by experts who are not only very efficient in their respective departments but are also very good teachers I have been on the books of this college since 1912, attending a few months at a time every few years I therefore speak from real experience on the value of the college, and I think I am voicing the feelings of all graduates who have attended and are attending the hospital

The loss to graduates is a very big gain to undergraduates and I would offer my congratulations not to the West London Hospital but to the undergraduate students There is a large amount of clinical material, and the physicians and surgeons concerned, whether in the out patient department in the wards or in the operation theatre invariably go all out to give students the best value Would it not be possible to let the West London remain a postgraduate college with special arrangements for undergraduates that will not clash with graduate study? The University of London would surely not disapprove of it as a place of study for the M B, B.S degrees for external students as well as a college for postgraduates—I am etc,

London W Dec 10 POSTGRADUATE

Auguste Forel and His Work

SIR—In his remarks on the autobiography of Auguste Forel in the issue of December 4 p 1121 your reviewer fails to appreciate the historical importance of this great man Although his study of ants dated from his earliest years and won him recognition as an authority in myrmecology unquestionably Forel's most important work is that on the sexual question which was translated into sixteen different languages and was published in as many editions the first in 1905 and the last in 1931 shortly before his death Next in importance comes his book on hypnotism, of which twelve editions were published and of which Pierre Janet (*Psychological Healing* 1925 **1** 195) writes This important work did much to spread Bernheim's teaching in Switzerland and subsequently in Germany undermining faith in Charcot's doctrine which at first received general acceptance No mention of those works is made by your reviewer while Forel's scientific campaign against alcoholism in which he received the help of the eminent physiologist von Bunge is dismissed with a few slighting words

On the other hand the high esteem in which Forel was held by competent critics during his life was shown on the occasion of his sixtieth and seventieth birthdays by special numbers dedicated to him of the *Journal für Psychologie und Neurologie* in 1908 and of the *Zeitschrift für die gesamte Neurologie und Psychiatrie* in 1918 to which contributions were made by Ramon y Cajal, Oppenheim, Piltz, Bleuler, Gaupp Spielmeyer, and many other eminent neurologists and psychiatrists

No less laudatory were the obituary notices Professor Douath of Budapest (*Z ges Neurol Psychiat* 1931, **136**, 642) described him as *decus humani generis* as well as a glory to his Swiss fatherland Professor Veraguth of Zürich (*Dtsch Z Neurol* 1931, **122**, 117) spoke of him as a dominant personality, and one of the founders of modern medical psychology and psychotherapy, and Adolf Meyer of Baltimore (*J nerv ment Dis* 1931 **74** 785) wrote Through the death of Auguste Forel the world has lost one of the outstanding and dynamic figures of Swiss science and medicine Forel stands as an example of pathfinding and practical creativeness of a high order

No mention is made by the reviewer of the attack at the age of 64 of cerebral thrombosis, of which Forel gave a masterly account in the *Journal fur Psychologie und Neurologie* in 1915 and 1924, nor of the dauntless manner in which he carried on his manifold activities—until his death nearly twenty years later—in spite of the grave disabilities caused by right hemiplegia and dysphasia followed by glaucoma in both eyes

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

493 Prognostic Value of Tuberculin Reactions

J HOLM (*Nord med Tidskr*, September 4, 1937 p 1456) gives an account of tuberculin tests of 1 608 medical students examined in Copenhagen in the course of three years Up to 1 mg of internationally standardized tuberculin was administered intracutaneously (Mantoux test), and all the positive reactors underwent screening which, if it revealed any shadows was supplemented by radiography As many as 1,192 showed a positive reaction among them were twelve students already known to be suffering from tuberculosis Of the remaining 1 180 positive reactors hitherto thought to be well nineteen were found on further examination to be suffering from more or less definite pulmonary tuberculosis ' Thus there remained 1,161 Mantoux positive students with normal lungs The subsequent fate of these students was compared with that of the 416 originally Mantoux negative students The Mantoux-positive group was periodically re-examined radiologically whereas the Mantoux negative group was periodically re-examined by tuberculin testing During the observation period not one of the 1 161 Mantoux-positive students developed pulmonary tuberculosis But of the 416 originally Mantoux-negative students there were as many as nineteen who developed pulmonary tuberculosis In the same observation period eighty-two of the 416 originally Mantoux negative students became tuberculin positive It would seem from these figures that a student who is tuberculin negative when first examined is more likely to develop pulmonary tuberculosis during his academic career than one whose reaction to the Mantoux test is positive from the outset

494 Eventration of the Diaphragm

A C SINGLETON (*Brit J Radiol*, September, 1937 p 677) discusses the rare condition generally referred to as eventration of the diaphragm its aetiology is still uncertain and it is usually discovered accidentally There is no history of injury, and the condition is probably congenital though phrenic nerve injury at birth may conceivably be the cause in a certain number of cases The radiographic examination reveals a high paralysed intact diaphragm The lesion practically always affects the left dome of the diaphragm, though a small number of cases in which the right diaphragm was involved have been observed There are no clinical symptoms and when physical signs are present they are not characteristic of eventration

495 Myasthenia Gravis

F S KENNEDY and F P MOERSCH (*Canad med Ass J* September, 1937, p 216) analyse a series of 108 cases of myasthenia gravis observed between 1915 and 1932 The analysis has not furnished any helpful information regarding the possible aetiology of the condition although some form of infection did appear to act as a precipitating factor in 31 per cent of the cases The age of the patients at the time of the onset of symptoms varied from 10 to 77 years but in the majority of cases the patients were affected during the third and fourth decades of life The disease may represent an acute rapidly fatal process or it may run a long mild course The average lapse of time between the first appearance of symptoms and the making of a correct diagnosis was about four and a half years In cases in which the disease is of the ophthalmoplegic type it is especially prone to be chronic and relatively mild. The most frequent early sign is a disturbance of the ocular muscles Weakness of the masseter muscles was present in only 14 per cent of cases Twenty seven patients had remissions of an average duration of 2 2 years Thirty four deaths occurred in the patients observed between 1915 and 1932 These cases had practically no treatment, and the mortality, therefore, represents essentially that of the untreated disease From 1932 the patients received adequate treatment embodying new therapeutic agents such as ephedrine and glycine, benzedrine sulphate, prostigmine and vaccines The results of this new therapy have been so striking that the authors believe that they are on the threshold of a definite understanding of the disease and of its rational treatment

Surgery

496 Spondylitis Deformans

J KRAFT (*Hospitalstidende* September 14, 1937, p 1017) has undertaken a study of 204 men and 100 women treated for spondylitis deformans in a Danish Red Cross hospital between 1930 and 1935 The age incidence of this disease was greatest between 45 and 55 for men and between 50 and 55 for women The youngest patient was only 23 years old It is unlikely that spondylitis deformans is a form of polyarthritis, for in this material the two diseases co-existed in only four men and two women It is also unlikely that spondylitis deformans is due to an infection of such structures as the intervertebral cartilages, for an infection would assuredly be associated with a high rate of sedimentation, and the author has found this rate to be relatively low in most of his cases The rarity with which spondylitis deformans is associated with a rise of temperature is also incompatible with the conception of this disease as an infection On the other hand spondylitis deformans was associated with arthritis and osteo-arthritis in other parts of the body in 16 per cent of the women and 25 per cent of the men in the author's material The seat of this associate arthritis was often the hip The author is pessimistic with regard to the prognosis for spondylitis deformans not given treatment This should consist of massage warmth, baths diathermy, and other electrical treatment. Failing relief from other measures, considerable benefits can be obtained by means of a corset supporting the spine and taking pressure off it

497 Regional Enteritis

J H. ZAAIJER (*Zbl Chir* September 11, 1937, p 2137) discusses on the basis of seven cases the clinical features of regional ileitis as described by American observers in 1932 since the caecum or colon may be affected, he prefers to call it unspecific regional enteritis The name *intestinal phlegmon* used in antecedent German descriptions is not always appropriate The most characteristic anatomical features are (1) the primary restriction of inflammatory conditions to a limited region of gut (2) the mimicry before and/or during operation, of ileo-caecal tuberculosis (Giant cells are not infrequently found, and they were present in one of Zaaijer's series but the condition is certainly not tuberculous) Clinically it frequently happens as in three of these cases that acute or subacute appendicitis is diagnosed other forms are those mimicking tuberculosis or recurrent invagination of the gut with colic diarrhoea and melaena, cases with some degree of stenosis usually diagnosed as carcinoma near the caecum and fistulous forms often confused with actinomycosis or tuberculosis Pyrexial attacks are common and a sausage shaped tumour may be palpable To show the difficulties of diagnosis Zaaijer mentions that the x ray demonstration of a "twisted cord which has been claimed to be characteristic of regional ileitis was found by him in two cases only—one of omental adhesion after perforation and one of enlarged mesenteric glands,

As regards the reviewer's charge of Bolshevism, Forel relates that, though he rejoiced at the overthrow of Czarism, on hearing of his election as a member of the New Russian Academy he declined to accept the honour unless the misdeeds of the Soviets ceased immediately—I am, etc,

London S W 6 Dec 5 J D Rolleston

Frumenty for Constipation

Sir—There is one perennial problem which is always facing physicians in general practice, and that is the problem of constipation Each age has boasted of discoveries which are proclaimed as being preventives or cures, but in spite of the constant succession of new claims as the result of new discoveries, there is no ailment more common to day and more difficult to deal with in a rational way I would like to draw attention, however, to the fact that before England was conquered by Scotland one heard very little of this trouble Amongst many sad results of the Scottish conquest there was the voice of the conqueror, which proclaimed that from that time onward porridge should be made of oats, and that no Englishman should have the right to call his own national wheaten dish porridge, and that all who wished to be loyal to the conquerors should henceforth begin their day with a bowl of oatmeal

If we turn to the ancient Saxon chronicles we find a phrase like this

> The reason given by the Churchwardens of Middlewych for not letting the school children come to church on the Wakes Sunday was that their little bellies will be so full of furmetty, that they will only be going in and out all Church-time

This is an illustration of the effect upon national health of the old English dish of 'frumenty" From a physiological point of view the demands of the body for proper functioning are fairly simple The food must be of a digestible character to stimulate the digestive organs It must contain a sufficient bulk to enable the muscles of the alimentary canal to function fully, and steadily pass on, inch by inch, the contents of the bowel, and this bulk must be of a somewhat spongy consistency, and should be neither very dry nor very soft The tendency of modern life is to aim at producing foods which are advertised as being "entirely digested Such a food, if eaten alone, does not fulfil the requirements of a physiological food, and sooner or later tends to produce early intestinal atrophy, unless this is counteracted by added purgatives

The life history of the liver fluke is an illustration of the effect of the use of entirely digestible foods, and the complete atrophy of the alimentary canal in the liver fluke is a striking warning of the evils connected with the too great use of 'completely digestible foods Without dealing with the other problems of dietary, I would like, therefore, to draw attention to the extreme value of the old English dish of 'frumenty' as a complete preventive of constipation in normal human beings As an old schoolmaster I recognize that the curse of constipation begins early in life, and that the habit of pill-taking which is so common in later years, has its origin in schooldays If, however, the English dish of "frumenty' is used instead of the Scotch porridge, constipation can be practically prevented In my own practice I advise a cupful to be taken once a day, and gradually increased up to three or four times a day until the bowel function is restored to normal Once this has been obtained the amount of frumenty can be reduced so that from once a day to two or three times a week 'frumenty" eaten with honey or black treacle and cream becomes a delightful dish as well as a food entirely curative of the serious evils resulting from constipation—I am, etc,

London, E C 4 Dec 11 Josiah Oldfield

Ether Convulsions

Sir—During six months as a resident anaesthetist in London I had the misfortune to have no fewer than five cases of so called ether convulsions All five completely recovered after a long post-operative sleep The technique of treatment which was taught me by Dr B Rait-Smith was, first, stop the ether, secondly, lower the feet and raise the head of the patient, and, thirdly, compress both common carotid arteries simultaneously for five to ten seconds The convulsions immediately cease In one case they began again, and the procedure was repeated If the convulsions do not stop, I maintain that the carotid arteries have not both been completely compressed This seems to me to be the easiest and surest method of dealing with the condition

I may add that in my opinion the convulsions are due to an overdose of ether under the conditions of the moment, usually in hot weather, in a toxic young patient. The overdose may be transitory, and even produced by carbon dioxide during induction, causing a sudden excess of ether vapour to be absorbed—I am, etc,

Ely, Dec 12 J B Bamford

"Stoppages" for Medical Charity

Sir—With reference to Dr Henry Robinson's article on "Legacies to Medical Charities" in your issue of November 27, I should like to go further than Dr Robinson, and suggest that in addition to legacies all medical men should contribute a small amount to the medical charities during their lives

There are approximately 16,500 "panel doctors" in England and Wales attending 16,500 000 insured persons if we include Scotland we might safely put these figures at 20,000 and 20,000,000 respectively My suggestion is that these 20,000 panel doctors be approacned through their panel committees and asked to sanction a 'stoppage of, say, a farthing per patient from their quarterly cheques in favour of the Royal Medical Benevolent Fund or other charities This small 'stoppage'—as the collier calls it—would amount to an annual sum of about £80,000, and would mean on the average an annual donation of £4 per panel doctor This as "the eye didn't see the heart wouldn't grieve after"

Colliers, by sanctioning small 'stoppages" from their weekly pay, are able to provide funds for building stately halls picture palaces, and baths, and I feel that the "panel doctor, if approached in the proper manner, would not be a laggard in contributing towards the well-being of his less fortunate brother's dependants

I hope that those who are best placed for judging this suggestion will give it their full consideration and determine the best ways and means of bringing such a scheme into being—I am, etc,

Llandilo Carm Dec 7 J H Lloyd

To mark the fiftieth anniversary of the foundation of the Victoria Dispensary for Consumption in Edinburgh—the first clinic for the diagnosis, treatment, and control of tuberculosis—the November number of the *American Journal of Public Health* has a sympathetic editorial entitled "Sir Robert W Philip—World Benefactor

and that in one apparently typical case operation four months after ileo-caecal resection showed tuberculosis of the colon Of Zaaijer's cases two showed primary disease of the ascending colon, five of the terminal part of the ileum The general opinion is that radical excision followed by anastomosis is called for, but cures have occasionally been seen after conservative treatment, or in cases judged inoperable Zaaijer advises (1) resection in one operation but if this appears too dangerous (2) ileocolostomy followed later by excision, and (3) in children, especially in acute cases closure of the abdomen with no other treatment than possibly, appendicectomy The prognosis except in advanced cases, is good, and Binney, in a collected series had a mortality of only 4 per cent All Zaaijer's patients recovered excisions were done in all save one, a child aged 7

498 Fractures in Childhood and Adolescence

N PAUS (*Norsk Mag Laegevidensk* September, 1937, p 1193) has undertaken a statistical analysis of the 270 patients under the age of 20 who received treatment for fractures of the long bones of the limbs at his hospital between 1921 and 1932 Only seventy-seven of these patients were girls, although under the age of 5 there were more girls than boys (twenty-five and twenty respectively) It would thus seem that the comparative masculine restlessness which is conducive to fractures does not show itself before this age With advancing years, and particularly after the age of 10 this characteristic feature of the male appears to develop more and more, for between the ages of 10 and 14 fractures were four times as common in boys as in girls, whereas between the ages of 15 and 19 they were five times as common (fifty males to ten females) Sixty-five per cent of the girls were under the age of 10, whereas 61 7 per cent of the male patients were over this age Three years or more after discharge the author re-examined 248 of his patients, and though some of them were cases of supracondylar fracture of the humerus all were found to be perfectly fit for work In sixty-nine out of seventy-seven cases of fracture of the femur recovery was excellent, whereas this was the case with only twenty-four of the thirty-nine cases of fractures about the elbow-joint In 195 of the 248 cases recovery was so complete that the site of the former fracture was only radiologically demonstrable The power of recovery diminished gradually with increasing age, under the age of 5 as many as forty out of forty-three patients showed an ideal recovery, whereas between the ages of 15 and 19 such a recovery could be claimed for only thirty-five out of fifty-three patients The author concludes that in the first twenty years of life the prognosis in these cases is more influenced by the patient's age than by the character of the treatment he receives

Therapeutics

499 Ultra-violet Treatment of Erysipelas

M E KNAPP (*Arch phys Ther* September 1937, p 572) refers to 510 cases of erysipelas treated by ultra-violet radiation alone The treatment gave consistently good results over a period of eight years The dosage varied, but in general ranged from 5 to 20 erythema doses applied to the involved area and a margin of one to three inches of normal skin Mercury vapour lamps were used in all the cases The resulting erythema was treated by applications of white vaseline The only complication resulting directly from erysipelas itself in the series described was abscess formation This occurred in about 6 per cent of cases In about 31 per cent of cases erysipelas was a complication of other pre existing diseases, and most of the deaths occurred in this group The treatment seems to be particularly useful in reducing the mortality from erysipelas in small children.

500 Plethora Rubra

E DRUSCHKY (*Med Klinik* September 3, 1937, p 1195) believes that the so-called 'red hypertension" is caused by a retention of metabolic end-products, including the xanthoproteins It is not yet quite certain whether there is not at the same time an avitaminosis, but it has been definitely proved that the condition can be favourably influenced by a suitable diet The 'red hypertension may finally develop in a number of ways (1) the high blood pressure may remain constant over a number of years, (2) it may result in an apoplexy, (3) it may give rise to attacks of angina pectoris, (4) cardiac failure may result, and (5) it may change into a "white hypertension' The treatment consists in the administration of cathartics in daily enemata, and in a fruit-juice diet This treatment is alternated by periods of raw food diet Physical therapy is carried out at the same time The author reports good results from this treatment in fifty cases

Diseases of Children

501 Influenza in Children

C A ALDRICH (*J Pediat* September, 1937, p 331) records his observations on 1,146 cases of influenza, in children of all ages, occurring between February, 1930, and January, 1936 During this period the disease appeared in yearly epidemics of considerable proportions, except in the winter of 1933–4, when there was a much smaller wave Laryngitis or croup arose in smaller epidemics at the same time as those of influenza, making it seem probable that croup is a manifestation of influenza in infancy The influenzal epidemics showed no chronological relation to the prevalence of general respiratory disease Otitis media and capillary bronchitis were by far the commonest complications, 70 per cent of the children who developed capillary bronchitis were known to be asthmatic The prognosis generally was extremely good, the only death being due to meningitis secondary to mastoiditis

502 The Vitamin B Complex

C LORING JOSLIN and SAMUEL T HELMS (*Arch Pediat* September, 1937, p 533), in order to study the effect of vitamin B on growth and weight, placed 100 infants alternately into two groups—Group A and Group B (the control group) The experiments were continued for a period of one year and the effect on weight, growth and constipation recorded at intervals Both groups were fed on a diet suitable for the age, the only difference being the addition of vitamin B to the diet given to Group A It was found that the infants in Group A increased in weight and height more quickly than did the control group It was also noted that the infants in Group A suffered far less from constipation than did those in Group B A further experiment was carried out with a series of nursing mothers, and it was found that if nursing mothers were given extra vitamin B their infants gained weight more quickly and were less constipated The addition of vitamin B to the diet of constipated infants relieved this trouble, and in the same way children with anorexia soon began to take food more readily when extra vitamin B was added to the diet

503 Normal Metabolism of Iron

H OLDHAM P W SCHLUTZ and M MORSE (*Amer J Dis Child* August, 1937, p 252) have studied the relative availability of inorganic and of organic iron in the diet of the normal infant The subject of their investigation was a normal healthy infant aged 6 months, it being presumed that by that time the iron store present at birth would have been largely depleted Foods were selected which for the most part are commonly used in infant

Obituary

J FRANCIS DIXON, M A, M D

Late Medical Superintendent Leicester City Mental Hospital

We regret to announce the death on November 26 after a long illness, of Dr J Francis Dixon of Littlethorpe House, Narborough, who retired in May, 1937 from the medical superintendency of the City Mental Hospital Leicester

Born in Dublin in 1871, he was educated at Merton College Surrey On leaving school he went out to New Zealand and spent some years ranching, after which he returned to Ireland and entered Trinity College Dublin, taking the B.A in 1896 and the M B B S B.A O in 1899 On qualifying Dr Dixon held resident appointments at Sir Patrick Dun s Hospital and the Royal City of Dublin Hospital, and at the outbreak of the Boer War he was accepted as a civil surgeon, going out to New Zealand on a troopship in charge of sick and wounded There he obtained a commission as medical officer to the New Zealand Mounted Rifles proceeding to South Africa with this unit serving there and returning with it to New Zealand He had intended taking up general practice in New Zealand, but for family reasons returned to this country After acting as house physician at the Bethlem Royal Hospital London in 1903, he decided to take up mental work as a career and was appointed assistant medical officer later senior and deputy medical superintendent at the Three Counties Asylum, Bedford In 1904 he graduated M D., and in 1911 M A In the same year he was awarded the certificate of the Royal Humane Society for attempting to save the life of a patient from drowning He was appointed medical superintendent at the City Mental Hospital, Humberstone, Leicester, in November, 1911

At Humberstone Dr Dixon soon introduced the policy that he was to pursue throughout his service there—namely, improvement of the welfare and treatment of the patients converting the institution from an asylum to a mental hospital and improving the conditions and training of the nursing staff The outbreak of the Great War soon interrupted this work and as he was already an officer in the Territorial Army he was mobilized in *1914*, proceeding to France with the North Midland Field Ambulance After sixteen months service he was demobilized on grounds of ill health, but on recovering resumed his military duties in 1916, and served in this country until May 1917, when, at the request of the Board of Control he was discharged from the Army and returned to Humberstone After the war he continued to develop his policy of improving the feeding and clothing of the patients under his care permitting increased freedom parole and leave of absence and latterly providing facilities for the treatment of psychoneurotic and early psychotic patients in out patient clinics and in the hospital as voluntary patients

Shortly before he retired the Visiting Committee converted an old Georgian house to a unit for the treatment of convalescent voluntary patients of both sexes under the one roof The provision of such a homely atmosphere for treatment had long been one of Dr Dixon s ideals so as a tribute to his work the house was named the Francis Dixon Lodge Another and earlier tribute was the publication in 1923 of the first number of the *Patients Magazine* written printed, and published entirely by the patients as a protest against the allegations being made against mental hospitals at that time Since 1923 the magazine has been published quarterly, and it continues to be a brightly written commentary on hospital events, with original articles Such a publication, and the reasons for it must be unique The present-day atmosphere of Humberstone and the good name it enjoys among the people of Leicester stand as a memorial to The Colonel, ' as he was affectionately known to his patients During the last few years his health broke down, and after an operation he retired in May, 1937

Dr Dixon was a member of the British Medical Association the Royal Society of Medicine, the Royal Medico Psychological Society, serving on the Council and on the Educational Committee and of the Leicester Medical Society, of which he would have been president two years ago but for indifferent health A good sportsman, he played Rugby football and polo in his youth and cricket till the war years, and until his last illness was a keen and excellent shot. He had a rare charm of personality that endeared him to all who met him, and was loved and esteemed by his patients and staff A genial and generous host, he was a raconteur with a ready Irish wit—a man with many friends The very large attendance of City Councillors, including the Lord Mayor of Leicester friends and colleagues, staff and patients, at the funeral service at St Mary s Church, Humberstone, on November 30 and at the memorial service in the Mental Hospital Chapel on December 5 was a fitting tribute to his memory He married Miss Helen S Seymour in 1928, and is survived by her

T W D

Dr DONALD FERGUSON who died on November 30 was born in 1861 the youngest son of the late Alexander Ferguson J P, Morvern Argyllshire He was educated at the Glasgow High School and Glasgow University where he graduated M.A in 1886 and M B C M in 1888 For forty two years he had practised in Warrington during which period he was a very active member of the British Medical Association He held office as chairman and representative of the Warrington Division and latterly as member of Branch council For a number of years he served as chairman of the Warrington Local Medical and Panel Committee which committee he represented on the Warrington Insurance Committee Apart from the British Medical Association and national health insurance he was interested in educational matters, and was a member of the Warrington Educational Committee for a number of years He was of an independent yet kindly nature, loyal and earnest in his friendships and simple in his tastes and faith He leaves a widow two daughters and two sons, one of whom is Dr Fergus R Ferguson, a consulting physician in Manchester

An unusually varied career ended with the death of Dr EDWARD ARTHUR ALDRIDGE at Worthing on December 4 The eldest son of the Rev E H Aldridge, he studied medicine at St Bartholomew s Hospital, and after qualifying L R C.P I in 1877 went out to China as medical officer to the Imperial Customs Maritime Service and practised for seventeen years in the interior of China in 1893 the high rank of Mandarin was conferred upon him by Imperial decree After returning to England he entered Trinity College, Cambridge graduating B.A in the Classical Tripos of 1898 and taking the M R C P I diploma in the same year He then went to Leeds Clergy School and was ordained after holding curacies he became rector of Sakly on Humber and later of Hanmington, Hants In the early months of the war he went to France as medical officer to the 1st Battalion of the Grenadier Guards was severely wounded received the

feeding As the infant became older the feeding was varied The child remained in good health during the time of the experiment The iron metabolism was studied for twenty eight periods each of five days Special methods were used to collect all urine and faeces even though the infant was able to run about the nursery The general plan of the study was to note the retention of iron and the formation of haemoglobin when different amounts of iron were taken Tables are given in the article showing the intake and excretion of all iron Retention of iron was found to be much higher with a diet which contained iron and copper salts than with one which contained the same amount of metals but with the copper in the form of a wheat germ product It is suggested that the vitamin B fraction in the wheat germ may in some way be responsible for this The iron of beef of which a large portion is organic was well utilized The optimal requirement of iron for a child less than 1 year of age seemed to be just a little over 0 5 mg per kilogramme of body weight

504 Congenital Anaemia

B S DENZER and J PARTER (*J Mt Sinai Hosp* N Y September–October 1937, p 117) report a case of congenital anaemia in an infant and discuss its relationship to the other forms of anaemia of the newborn The infant responded at once to a blood transfusion and the presence of a high percentage of reticulocytes and of nucleated red cells indicated good regenerative powers It is now recognized that congenital anaemia of the new born is closely related to universal oedema of the foetus and icterus gravis Congenital anaemia is the mildest of the three conditions and the salient features are anaemia erythroblastosis enlargement of the liver and spleen and jaundice. The case is compared with others recorded by various writers The pathology of congenital anaemia is discussed, and its close relation to erythroblastosis is shown in a detailed table of symptoms and signs The authors think it is biologically sound to believe that a single factor, effective possibly at different stages of development, may cause such diverse conditions as universal oedema, icterus gravis and the various types of congenital anaemia Treatment consists in blood transfusion, given early, for without this the prognosis is poor

505 Diphtheria Immunization

C JENSEN (*Ugeskr Laeg* October 7, 1937 p 1037) reports from the State Serum Institute in Copenhagen and from the Blegdam Fever Hospital the investigations he and his colleagues have undertaken in connexion with diphtheria immunization. He points out that the system of giving three successive subcutaneous injections of some diphtheria antigen has proved unsatisfactory in practice because so many persons fail to present themselves for the second and third injections On the other hand unless the quantity of antigen is large enough to give a violent local or general reaction a single subcutaneous injection is incapable of creating an effective immunity He has, he believes, found a satisfactory middle course He gives a single injection of purified toxoid with aluminium hydroxide and then instils intranasally purified toxoid He began using this method in 1933 and in addition to applying it to many children he has studied its effects in about 600 nurses between the ages of 20 and 30 Four weeks after the preliminary subcutaneous injection he gives three intranasal instillations at intervals of one week and he has found that these instillations of isotonic neutral toxoid provoke no general reaction while the local reaction is limited to a slight sense of tickling at the time of the instillation As an additional precautionary measure under conditions calculated to promote the chances of infection the instillation can be repeated (A preliminary communication on this subject made by Dr Jensen to the Royal Society of Medicine was reported in the *Journal* of April 17 at page 826)

506 Peptic Ulcer in Childhood

According to N TORO (*Pediatria* Naples October 1, 1937, p 904) acute gastric or duodenal ulcer is not very uncommon as a result of congestion or embolus, in infancy in later childhood ulceration is more often chronic It is certain that acute ulcerations occurring within the first year and demonstrable by haemorrhagic signs may in some cases go on to the formation of chronic ulcers and Proctor at the Mayo Clinic found that 2 1 per cent of adult patients with peptic ulcer had symptoms dating from infancy The literature contains about 100 authenticated cases of chronic peptic ulcer from the ages of 2 to 14, duodenal and pyloric predominating over gastric The greater incidence apparent during the past twenty years is probably due in part to the more careful supervision of children s health While it was formerly held that perforation and bleeding were specially frequent in ulceration in childhood during the past ten years perforation has occurred in 14 per cent only of reported cases—a figure not far removed from the incidence of perforation in adults The gastric acidity is usually normal The diagnosis should be more often suspected, and can be confirmed radiologically The prognosis in childhood is a little more grave than in adult life, both because of the greater frequency of acute ulceration and of the difficulty of securing efficient and prolonged medical treatment This should always be tried in the first place but the outlook for operative treatment is very favourable No death appears to have occurred from operation in non-perforated cases six cases of resection being included Toro reports three cases of ulcer near the pylorus in children aged 10 to 12, successfully treated by gastro-enterostomy

507 Generalized Vaccinia

J D ROLLESTON (*Brit J Child Dis* July–September, 1937 p 187) who records an illustrative case, states that vaccinia is a rare condition and with a few exceptions is found exclusively in children The following statistics indicate its rarity in different countries France, six to eight cases among 500 000 to 600 000 vaccinations, Germany fifty to sixty cases in 2,285 578 vaccinations and Denmark four cases among 39 915 vaccinations As a general rule the prognosis is good and the condition is only likely to be serious and even fatal, when it supervenes on a pre-existing dermatosis especially eczema seborrhoeic dermatitis or impetigo According to modern views generalized vaccinia is due to a haematogenous outcropping of the virus of the vaccine which enters the blood stream even when vaccination follows its usual course Its rarity is due to the fact that the balance between the virus and the virucidal substances in the blood is not often disturbed in persons with an intact skin whereas eczema and other pre existing dermatoses are liable to upset this balance Rolleston s case was that of a male infant aged 7 months who developed a generalized vaccinial eruption after a single insertion of Government lymph The lesions though generalized were sparse, the face and trunk being little affected There was no constitutional disturbance and apart from a severe attack of gastro enteritis recovery was uneventful

508 Treatment of Tuberculosis

K KLARE (*Dtsch Tuber bl* November 1937 p 261) traces the evolution of the treatment of tuberculosis in childhood during the twenty six years he has specialized in this subject and the twenty years in which he has been in charge of a hospital for tuberculous children in Scheidegg He has repeatedly noticed that the immediate success of a preventive course of sanatorium treatment in childhood has been stultified by the outbreak of open pulmonary tuberculosis at puberty The mortality of open pulmonary tuberculosis in childhood and adolescence is about 80 per cent The author has found that

Military Cross, and attained the rank of major, R A M C (T) In 1922 he was transferred to the R.A F Medical Service as squadron leader From 1926 to 1928 he was British chaplain at Rouen, and afterwards for some years rector of Wiston, near Steyning, Sussex A kindly man, of untiring energy and zest for life, his chief outdoor recreations were mountain climbing hunting, and cross country running, at which he excelled even at an advanced age

The death of Mr JOSEPH JOPLING BROWN, announced in this column on December 4, has caused widespread sorrow in Newton Abbot His health had not been good for some time but he was working in full harness up to the day before his death Soon after proceeding to the M S degree and the F R C S Ed, he sailed as ship s surgeon on the *Falaba* and was at sea when war was declared in August, 1914 He obtained a commission in the R A M C, and went direct to the Dardanelles in 1915, he served in Gallipoli and was invalided home, but continued war service in several large military hospitals In the latter part of 1922 Dr Brown went from Barnsley, where he had practised since the war, to Newton Abbot for reasons of health, and was appointed to the surgical staff of the Newton Abbot Hospital He soon secured a large practice and became popular among all classes of the community He was actively associated with many organizations, and keenly interested in Freemasonry, sport, and music

A correspondent sends us some further details of the career of Dr MARSHAM A BECKETT MCCARTHY of whom an obituary notice appeared on December 11 Dr McCarthy returned to this country from New Zealand early in the war, and worked continuously at Millbank as captain R.A M C until he was demobilized Later he was at the headquarters of the Ministry of Pensions, under Dr Gossage, until his services were no longer required In New Zealand, among his many professional interests and activities he was colonel R.A M C (Vol) Dr McCarthy's lifework was entirely devoted to the benefit and service of others

Dr FRANCIS WILLIAM O CONNOR (whose obituary was published on November 6, p 942), after serving as assistant director of the Division of Medical Education, Rockefeller Foundation, in 1928 became Director of the Department of Tropical Medicine and Associate Professor of Medicine at Columbia University

The following well-known foreign medical men have recently died Senator ALESSANDRO LUSTIG formerly professor of general pathology at Florence and author of a treatise on general pathology, aged 80, Professor GIULIO MASINI formerly director of the dermatological clinic at Genoa, aged 84 and Dr ETIENNE ROLLET professor of clinical ophthalmology at Lyons from 1905 to 1932, aged 75

The Colyer prize was founded in June, 1926, to commemorate the twenty-five years' service of Sir Frank Colyer as honorary curator of the Odontological Museum The accumulated income of this fund may be used every third year for the purpose of awarding a prize for the best original work in dental science completed during the previous five years by a dental surgeon educated at any duly recognized dental school in Great Britain or Northern Ireland who has not been qualified to practise more than five years at the date of the award Applications from candidates for the third award should be submitted to the Royal Society of Medicine, 1, Wimpole Street, W 1, not later than March 31, 1938, together with a general account of their researches, both completed and in progress A document declaratory of the award will be presented with the prize If no work of sufficient merit be submitted the prize will not be awarded.

Universities and Colleges

UNIVERSITY OF OXFORD

Dr A G Gibson Nuffield Reader in Morbid Anatomy has been elected to a Professorial Fellowship at Merton College

The following candidates have passed in the subjects indicated

MATERIA MEDICA AND PHARMACOLOGY—G F Bader, J J Brenner, E G W Clarke A J F Eberle A R Elsom J C Hawks J C Hill, R Park, G L L Reynolds M G Simmons W J Tyson, E J Wood *Woman* V D Maxwell

* Honours † Distinguished in medicine ‡ Distinguished in pathology § Distinguished in forensic medicine and hygiene ‖ Distinguished in surgery ¶ Distinguished in obstetrics and gynaecology

At a recent meeting the University Court was informed that a gift to the Middlesex Hospital Medical School of £500 had been made by an anonymous donor to form The Rudyard Kipling Fund to be applied by gift or loan to students or recently qualified men of the School to enable them to continue their studies which might otherwise have to be abandoned owing to financial stringency It was also informed of

tuberculosis of the bronchial glands and infiltrations of the lungs require on an average six months' treatment The same interval is required for discharging cervical glands whereas lupus with its tendency to recur, and tuberculosis of the bones and joints take a much longer time to heal The larger the joint the longer the time required for recovery, and while tuberculosis of the hand elbow, knee, and foot may be cured in a year to a year and a half, tuberculosis of the spine requires two years and tuberculosis of the hip from two to three years As for the length of the observation period before a permanent cure can be claimed, ten years' observation is needed for open pulmonary tuberculosis, and five to seven years for extra pulmonary tuberculosis Giving the immediate results on discharge from his hospital for what they are worth, the author states that of nearly 9 000 patients, 66 3 per cent were discharged as good results, 28 4 per cent as improved, and 5 3 per cent as not improved He has abandoned overfeeding and other devices for excessive fattening of his patients, and he has found heliotherapy most dangerous and quite unsuited for cases of pulmonary disease Even the benign inflammatory forms of intrathoracic tuberculosis in childhood are unsuited for ultra-violet therapy

Obstetrics and Gynaecology

509 Cotte's Operation

L KRAUL (*Zbl Gynäk* September 18, 1937, p 2218) simplifies Cotte s operation of section of the superior hypogastric plexus by removing a length of 3 to 4 cm of the tissues between the lower mesenteric veins on the left and the iliac veins on the right, between the peritoneum and periosteum of the fifth lumbar vertebra, instead of dissecting out the plexus He also supplements it by division of the ovarian plexus in the infundibulopelvic ligament As well as for relief of pain in dysmenorrhoea, neuralgia, and inoperable genital carcinomata, Kraul has done Cotte s operation, with good results, (1) in inflammatory adnexal conditions when radical excision is technically difficult or inadvisable on account of the patient s youth or reduced general condition and (2) at the conclusion of total hysterectomy to prevent pain from adhesions and residual pelvic inflammation

510 Transvesical Closure of Vesico vaginal Fistulae

M DOUGLASS (*Surg Gynec Obstet* October, 1937, p 534) points out that closure of high vesico-vaginal fistulae is a difficult surgical procedure When the fistula is situated in an accessible part of the anterior vesical wall and when the uterus is *in situ* the classical method used by the majority of gynaecologists may be suitable, but in certain cases the transvesical route gives better access With a deep Schuchardt incision many apparently inaccessible fistulae can be reached, but the transvesical method of closure is recommended in cases with marked fixation due to repeated unsuccessful attempts at repair , in those cases in which the fistula is closely adjacent to the ureteral orifice , or when the uterus has been removed Four cases are reported in which a vesico-vaginal fistula was closed in one attempt by the transvesical route A suprapubic incision was made and the fistula elevated by means of a safety pin in the form of a hook The mucosa was incised and reflected, and concentric purse-string sutures were so arranged as to evaginate the fistula into the vagina The mucosa was then sutured with interrupted chromic catgut No 00, and the anterior bladder wall was closed with interrupted plain catgut sutures and the fascia approximated with interrupted stitches A large suprapubic catheter was inserted The patients were nursed in the prone position for thirteen days, the bladder being kept entirely empty In all four cases the results were satisfactory Transvesical closure is recommended as the method of choice in the treatment of small but inaccessible vesico-vaginal fistulae on account of the ease of access to the operative field, which can be kept dry, and the relatively easy exposure of the fistula , sutures can also be placed accurately with little or no trauma to the tissues

Pathology

511 Inactivation of Tetanus Toxin by Vitamin C

C W JUNGEBLUT (*J Immunol* , September, 1937, p 203) quotes observations by various authors which have shown that diphtheria toxin, poliomyelitis virus, encephalitis virus, and the tobacco mosaic virus may be inactivated by *l*-ascorbic acid In the present paper evidence is brought forward to show that ascorbic acid may also inactivate tetanus toxin Mixtures of 2 m l d of toxin and either natural or crystalline vitamin C (*l*-ascorbic acid) if incubated for half an hour became non toxic to guinea-pigs Inactivation is not due to the presence of the acid as such, since experiments showed that the toxin was not injured by exposure to a *p*H of 6, which is lower than that of the ascorbic acid It may be due to the oxidation of the reduced ascorbic acid, but no conclusive evidence could be found to support this explanation It may be noted that, though ascorbic acid neutralizes tetanus toxin *in vitro* it confers little or no protection on animals that have already been inoculated with toxin. Even when given in large doses subcutaneously it was able to save the lives of only four out of sixty guinea pigs that had been injected with 2 m l d. of toxin

512 Allergic Reactions

K HANSEN (*Med Klinik* August 6, 1937, p 1057) lists the syndromes formerly known as 'idiosyncrasies,' but now regarded as allergic—namely, serum sickness, hay fever, asthma, urticaria, certain affections of the mucous membranes, the digestive tract, the skin, and the reproductive system (including haemorrhage and spontaneous abortion), migraine, Ménière's syndrome, muscular and articular rheumatism etc Skin and mucous membrane are the barriers which normally resist the entrance of foreign bodies into the system , but bacteria, quite apart from the possibility that they may themselves act as antigens, play an important part in breaking down this resistance The typical local manifestation of allergy, which Rössle calls "hyperergic inflammation' (brisk exudation with extreme contraction of the vessels, and fibrinoid swelling of the connective tissue, which may even go on to local necrosis, followed by the formation of granulomata) is a sign that the body is doing its utmost to oppose the penetration of the antigen The allergic asthma attack also is a defensive reaction According to Hansen, two groups of disturbances may result from allergic causes (1) Those consisting essentially of functional changes which are reversible and leave no permanent trace behind them, as in migraine, transient affections of the oculomotor or facial nerves, and Ménière s syndrome Other examples of this group are urticaria, and Quincke s oedema, paroxysmal tachycardia, and angina pectoris Allergic angina would appear to be due to spasm of the coronary arteries in a person sensitized to some particular antigen—for example, salicylic acid, ragweed, phenolphthalein carrots, tomatoes, milk, eggs, spinach, cabbage, or even digitalis and strophanthin (2) The second group includes those cases involving deep structural and therefore irreversible, changes in the tissues These are all expressions of a haematogenous hyperergic inflammation, and result in the formation of granulomata A granuloma, even in the case of specific diseases such as syphilis tuberculosis, typhoid, etc , Hansen regards as being always an expression of an allergic reaction

gifts to University College Hospital Medical School of £5 000 by an anonymous donor to be applied to purposes of original research in the Department of Dermatology and £200 from Mrs A M Suckling of Edgbaston Birmingham for the purpose of establishing a prize in obstetrics and gynaecology

Studentship in Oto rhino-laryngology

Applications are invited for the Geoffrey E Duveen Travelling Studentship of the value of £450 for research in any aspect of oto-rhino laryngology — The studentship is normally tenable in the first instance for one year part of which shall be spent in study abroad in accordance with a scheme to be approved by the Studentship Board but it may be extended for six months or for one or two years and during the extended period the student may be allowed to undertake research at the Royal Ear Hospital or some other laboratory approved for the purpose Full particulars can be obtained from the Academic Registrar University of London W C 1 and prescribed forms of application must reach him not later than December 31

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

Part-time Course in Mental Deficiency

The London School of Hygiene and Tropical Medicine in co-operation with the Central Association for Mental Welfare will hold a part time course in mental deficiency in February and March 1938 The course which is designed to enable medical practitioners to qualify for recognition as certifying officers as far as elementary school children are concerned under the Mental Deficiency Acts will be held in the afternoons and will be open to a limited number principally those employed as assistant school medical officers The fee for the course is six guineas

UNIVERSITY OF SHEFFIELD

At a meeting of the University Council held on December 10 the registrar was instructed to send the council's congratulations to Sir Edward Mellanby on his appointment as Honorary Physician to the King

Dr R W John was appointed research assistant to the Department of Pathology

Dr M A. MacConaill was appointed representative of the University at the International Congress of Anthropological and Ethnological Sciences to be held at Copenhagen in August 1938

Sir Arthur Hall and the Dean of the Faculty of Medicine Professor G A Clark were appointed representatives of the University on the executive committee in connexion with the million pound appeal for the voluntary hospitals of Sheffield

UNIVERSITY OF DUBLIN

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A Council meeting was held on December 9 with the President Sir Cuthbert Wallace Bart. in the chair

Permission was given for the Society of Medical Superintendents to hold a meeting at the Buckston Browne Surgical Research Farm Downe Kent on Thursday May 19 1938 and for the Anatomical Society to hold a meeting at the College and at the Buckston Browne Surgical Research Farm in June 1938

The Council gratefully received a gift from Lady Bland Sutton of an autographed copy of the Hunterian Oration delivered by Sir John Bland Sutton in 1923 and an autographed copy of the speech delivered by Mr Rudyard Kipling at the Hunterian Dinner the same evening. The Council also received with thanks from Mr L R Braithwaite a miniature of John Abernethy

Diplomas

Diplomas of Fellowship were granted to the following forty four candidates

P McG Moffatt G Hyman J H Hughes A K Monro R G Gilbert R G Reid, G C Sawyer F W Shepherd W R Hunter D R Davies G A Myers M B Khan A H Hunt T G Tregaskis A F Bryson H M McGladdery J L *Collis* H T Laycock A H M Siddons D Bhatia B B Hickey F B Thomas S Glaser L J Honeywill J Hanekom, P T Joseph B N Bandyopadhyaya J W Cope S K Datta C S Day Gladys H Dodds G K Harrison T J B A MacGowan B T H Mattelmsson G M Mes G N Morris R K Reeves A M Rennie A H Sangster W N Searle H A D Small R G Taylor N J Townsley J F Ziegler

Diplomas in Anaesthetics were granted jointly with the Royal College of Physicians of London to the following twenty four candidates

A H L Baker A H Bruce Eva G Byrde J C Buckley Bessie E Cook Ellen B Cowan M H A Davison A J S Da Freitas L M De Silva S F Durrans Florence Faulkner W B Gough G Gray J R G Harris J K Hasler Ursula Y Im Thurn Freda C Kelly J O Moffat D A Prothero G R Rawlings Captain W H Scriven R.A.M.C E W O Skinner G C Steel O Walker

It was reported to the Council that at the examination for the Primary Fellowship just concluded in Australia three candidates out of six were successful at Sydney and seventeen out of thirty five were successful at Melbourne

Lectures

The Council arranged for lectures to be given in February next by Sir Arthur Keith F.R.S on the Mount Carmel skeletons and by Dr W E Gye director of the Imperial Cancer Research Fund on cancer research

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

At a meeting of the Royal Faculty of Physicians and Surgeons of Glasgow held on December 6 with the President Dr John Henderson in the chair the following were admitted Fellows of Faculty Kenneth Fraser M.B Ch B Alexander Lyall M B Ch B Rustom Jal Vakil M B B S Anna Varred M B B S

J Caspersen (*Norsk Mag Laegevidensk* October 1937) gives an account of a Norwegian community of some thousand persons of whom six developed typical paratyphoid fever while three others harboured paratyphoid bacilli in the stools without presenting any clinical signs of the disease With only one exception this epidemic was confined to three houses The community derived its water supply from two main sources and its milk supply from one and neither supply could be incriminated. Numerous tests of the blood stools and urine of possible carriers were at first negative but the concentration of most of the cases in one house drew attention to a year and a half old dog. It transpired that the animal had suffered from violent diarrhoea in the first half of February It had recovered about March 1 and it was in this month that the epidemic broke out. Though no paratyphoid bacilli could be found in the dog's stools agglutination tests were positive in a dilution of 1 in 320 after two hours Twenty three samples of blood from other dogs served as controls, and none of them gave a positive agglutination reaction.

SOUTH AFRICA

Where Winter's ICY GRIP *is forgotten*

NO linguistic difficulties hamper your enjoyment No culinary deviations enforce dietary readjustment An abundance of luscious fruits, a myriad of lovely flowers set in a blaze of scenic grandeur A holiday in South Africa need not occupy more than eight to ten weeks, and it can be planned at a cost to suit your pocket Consult the Travel Bureau in South Africa House, Trafalgar Square, London, W C 2, or the principal Travel Agencies

The Services

HONORARY SURGEONS TO THE KING

The King has approved the appointment of Colonel S G S Haughton C I E. O B E V H S and Colonel N M Wilson O B E I M S as Honorary Surgeons to the King in succession to Major General E A Walker, C B, and Major-General Sir Frank P Connor, D S O, I M S, who have retired

MILITARY CROSS

The King has approved the award of the Military Cross to Captain James Alexander Deanes Johnston, R.A M C, for distinguished services rendered in the field in connexion with the operations in Waziristan during the period November 25, 1936, to January 16, 1937

DEATHS IN THE SERVICES

Colonel THOMAS ELWOOD LINDESAY BATE C I E. C B E., Bengal Medical Service (ret) died in Dublin on December 3, aged 85 He was born on July 29 1852, the son of Thomas Bate chief officer of coastguard at Ballygarry, County Wexford educated at the Adelaide Hospital Dublin and took the L R C P and S I in 1870 He entered the Indian Medical Service as surgeon on March 31 1875, attained the rank of colonel on July 13 1905 and retired on July 12 1910 He served in the second Afghan war in 1878–80 and received the medals Most of his service was passed in the Punjab in civil employ, which he joined in 1880 In April, 1891 he was appointed Inspector General of Jails in the Punjab, and in July 1905 Inspector General of Hospitals in the same province He received the C I E on June 26 1902 and the C B E on January 7, 1918, for services in England during the war of 1914–18

Lieut Col. WILLIAM GAVIN HAMILTON I M S (ret) was killed in the railway accident at Castlecary, near Falkirk, on December 10 at the age of 63 He was born on October 4 1874 was educated at St. Bartholomew s Hospital and took the M R C S Eng L R C P London in 1899, and subsequently the D P H at Cambridge in 1913 He entered the I M S as lieutenant on June 28 1900 became lieutenant-colonel on December 28 1919, and retired on October 4 1929 He served in the war of 1914–18 in Egypt and on the hospital ships *Syria* and *Vascova* He served in the Jail Department in Bengal and prior to his retirement held the post of Inspector General of Jails He was elected a member of the British Medical Association in 1900, and was an associate member of the Edinburgh Branch and the Edinburgh and Leith Division of the Association

Medical Notes in Parliament

The Royal Assent was given on December 9 to the Expiring Laws Continuance Act and the National Health Insurance (Juvenile Contributors and Young Persons) Act

The House of Commons will rise on December 23 and meet again on February 1 This week good progress was made in the House with the committee stage of the Coal Bill A debate was arranged on the Special Areas and unemployment The Blind Persons Bill, with amendments, was read a third time in the House on December 7

The Housing (Agricultural Population, Scotland) Bill was reported with amendments to the House of Commons on December 9 from the Standing Committee on Scottish Bills

The Pharmacy List (Amendment) Order, 1937, and the Poisons Amendment Rules, 1937, both dated November 2, were laid on the table of the House on December 13

Training Doctors in Treatment of Gas Cases

In the House of Lords, on December 13 Viscount SWINTON moved the second reading of the Air Raid Precautions Bill He said that a special system of training had been instituted for doctors The Home Office, in co operation with the British Medical Association had selected sixteen doctors from different parts of the country for special training in medical treatment of gas cases These sixteen doctors had already passed through the special course something like 10 000 doctors and 10 000 nurses He was told that that was unequalled in any country

The Bill was read a second time

Medical Officers of Health and Private Practice

Lord MERTHYR gave notice that in the House of Lords, on December 15, he would ask how many county councils in England and Wales had failed to formulate arrangements for securing that medical officers of health should not engage in private practice as medical practitioners, and what steps were proposed for ensuring better observance of the law

Typhoid and Sewage Discharge into Sea

Captain PLUGGE asked on December 9, whether inquiry had been made as to the danger of cases of typhoid fever being caused by people bathing in the sea into which crude sewage was discharged Sir KINGSLEY WOOD said investigations by the Royal Commission on Sewage Disposal showed that any sewage discharged was rapidly rendered innocuous in the sea Sewage was so discharged by many towns, but before approving schemes the Ministry of Health required tidal observations to be made to ensure that the outfall was placed where the sewage would be carried out to sea and not returned to the beaches.

Compulsory Pasteurization of Milk

The Conservative Agricultural Committee at the House of Commons on December 7, resolved that the advisability of compulsory pasteurization of milk should be reconsidered by a Royal Commission The committee noted the existing wide divergencies of opinion between doctors on the advantages and disadvantages of pasteurizing milk, and noted reports that in some countries the adoption of this policy had led to disregard of the production of clean milk from healthy herds It further noted that the Economic Advisory Council s Committee on Cattle Diseases reported pasteurization to have a destructive effect on vitamins C and D in milk

Population Bill Questions Amended

In the amendments to the Population (Statistics) Bill the number of questions to be asked on registration of a birth or death has been limited provision is made for secrecy even in relation to proceedings in a court of law Paragraph 3 of the schedule will be deleted, and no further questions can be asked under the provisions of the Bill The questions to be asked will be

On Registration of a Birth—(*a*) The age of the mother (*b*) the date of the marriage, (*c*) the number of children of the mother by her present husband and how many of them are living and (*d*) the number of her children by any previous husband and how many of them are living

On Registration of a Death—In the case of a man, whether he had been married and if so, whether he was married at the date of death In the case of a woman who had been married (*a*) the year of her marriage and the duration of the marriage, (*b*) whether she had children by her husband or a former husband and in the case of husband or wife, the age of the surviving partner

The Bill will no longer contain questions which raise any point regarding legitimacy or questions relating to dependants brothers and sisters The questions now to be asked on birth registration will, by ascertaining the number of children,

A DISTINCTIVE PRODUCT WITH A TWO-FOLD PURPOSE

EMULSIO SULPHONAMIDI

(EMULSION OF p-AMINOBENZENESULPHONAMIDE WYLEYS)

An effective bactericide and prophylactic for employment in the oral treatment of Acute Puerperal Sepsis, Erysipelas, Tonsillitis, and Gonococcal Infections

Reports announce In one hospital the maternal mortality of puerperal fever was reduced from 22 7 to 4 7 per cent And Of 47 cases of gonococcal infections of the genito urinary tract 36 showed that the gonococci and urethral discharge had cleared up in less than five days

A pleasantly flavoured product containing 7½ grains (0 5 gm) of p Aminobenzenesulphonamide in each fluid drachm (4 c.c.)

Price 6/ per 8oz. bottle 16oz., 11/6 In bulk, 11/ per lb

CHILBLAIN

cured in 36 hours

Striking testimony to Sphagnol Peat Ointment

Since few people can stop working because of chilblains some effective local treatment is essential Sphagnol soothes and cools chilblains with the first dressing And concerning Sphagnol s effectiveness, a doctor has written

"I found the preparations you sent me remarkably good, especially the ointment, which cured an intractable chilblain in 36 hours" Signed ——, M D Test Sphagnol personally On receipt of a postcard we shall be pleased to send you a sufficient supply

SPHAGNOL

Peat Products (Sphagnol) Ltd , Dept B 222,
21, Bush Lane, London, E C 4

show the fertility of the mothers in connexion with which also it is necessary to know the age of the mother and the date of the marriage On the questions to be asked on death registration those which ascertain the age of the surviving wife of a deceased married man are similarly necessary for the effective use of the fertility information The remaining questions will provide information on childless marriages

No date is yet named for the committee stage of the Bill

Small pox Experiments with Inactivated Vaccinia Virus—Mrs. TATE asked on December 7 what action was being taken to meet what the Rolleston Vaccination Committee in its second report in 1930 described as the urgent necessity of trying to find some means of protection against small pox other than that of the direct introduction of a living virus into the organism Sir KINGSLEY WOOD replied that experiments were carried out in 1929 and 1930 at the Freedom Research Laboratories of the London Hospital to test what immunity if any, could be produced by inactivated vaccinia virus A report was published in the *Journal of Hygiene* for January 1932. Though slight immunity was produced in some cases the results of the experiments gave little assurance that solid immunity could be produced in this way

Microscopes for Ship Surgeons—On December 7 Mr OLIVER STANLEY informed Major DOWER that the provision of microscopes for ship doctors on long voyages was fully examined in consultation with the Royal Colleges of Physicians and Surgeons, the Ministry of Health and the shipowners some years ago and it was decided that there was not a sufficient case for making the provision of microscopes compulsory He was having the question reviewed

Death Certification in Herbalist's Case—Mr BERNAYS told Mr W Leach on December 8 that he knew a Darlington woman was recently prosecuted for failing to call in a doctor during the fatal illness of her five year old boy Mr LEACH asked why as the child had previously been treated by a herbalist, the local registrar refused to accept the herbalist's statement as to the cause of death and whether "in view of the fact that the great majority of the 3 000 children who die in this country every year from diphtheria have been treated with antitoxin by a registered medical practitioner the Minister would amend the law relating to the certification of death Mr BERNAYS said the Registrar of Births and Deaths reported the death to the coroner in accordance with the regulations which required him to report any death the cause of which was not certified by a registered medical practitioner in attendance during the last illness In these circumstances the Registrar was required by law to enter in the register the cause of death as certified by the coroner Sir Kingsley Wood did not propose to take any steps to amend the law relating to the certification of death

Small pox and Vaccination at Oldham—Mr VIANT asked on December 9 how many days elapsed between the discovery of the first small pox case at Oldham in 1936 and the vaccination of the contacts Sir KINGSLEY WOOD said the first vaccinations of contacts were carried out the day after the diagnosis of the first patient was established and twelve days after her illness began The number of contacts vaccinated or revaccinated was 282 The number of subsequent cases was ten, including one doubtful one Of these four patients varying in age from 54 to 72 were vaccinated in infancy one aged 41 was vaccinated in 1916 and five including the doubtful case were unvaccinated

Isolation Period in Infectious Diseases—Mr CROWDER asked on December 9 if the attention of the Minister of Health had been called to the practice of certain hospitals in discharging patients who had suffered from infectious diseases while still able to transmit such infection to other people and whether he would issue instructions to the local authorities and others concerned to ensure that strict isolation was insisted upon in such cases Sir KINGSLEY WOOD said his attention had not been called to cases of this kind There was no definite period of isolation after which scarlet fever patients could be guaranteed free from infection but he had no knowledge that it was the practice of any hospitals to discharge patients while they were known to be a potential source of infection It was the general practice as an added precaution to advise that the patients should so far as possible be isolated at home especially from susceptible children for a fortnight or so after discharge He did not think the issue of instructions would serve any useful purpose

Capital Contributions to Voluntary Hospitals—Mr LIPSON on December 9 asked the Minister of Health to consider taking powers to enable him to make contributions to voluntary hospitals towards the cost of schemes of capital expenditure approved by him Sir KINGSLEY WOOD answered that local authorities could make capital contributions to voluntary hospitals and in many instances had done so The powers suggested did not therefore appear to be necessary

Packing Straw and Foot and Mouth Disease Virus—On December 13 Mr W S MORRISON informed Mr Short that he was aware that importers of goods from the Continent used packing straw over and over again and research had been made into the question whether this straw might be a source of foot and mouth disease The experiments of the Foot and Mouth Disease Research Committee showed that on hay and straw the dried virus of foot and mouth disease might remain active for some weeks but in the absence of evidence against this material there did not appear to be any case for further action

Free Meals and Milk to School Children—Mr KENNETH LINDSAY furnishes the following details concerning public elementary schools maintained by local education authorities

Number of Children Receiving Free Meals and/or Free Milk as a Percentage of the Total Numbers on the Registers

Type of Area	Number of Children on the Registers on March 31 1937	Number of Children who received Free Meals and/or Milk in June 1937	Percentage Col. 3 of Col 2
(1)	(2)	(3)	(4)
England and Wales Total	5 123 490	419,334	8 18
Counties	2,044 180	158 617	7 76
Boroughs and urban districts	838,298	62,469	7.45
County boroughs	1 774 126	168 081	9 47
London	466 886	30 167 (approx. figure)	6.46

Notes in Brief

Prescriptions of insulin to diabetics under the National Health Insurance Act now number well over a quarter of a million a year and show an increase of nearly 28 per cent over the period of four years

On a total establishment of 12 283 female nurses in public mental hospitals the shortage is 758

In the last three years schemes for supplying water in rural areas have been approved for 2 400 parishes at a total estimated capital cost of £7,500 000

In the twelve months ended November 30 last the numbers of soldiers admitted to hospital on account of cerebrospinal fever were London 8 Woolwich 4 Caterham 3 Bury (Lancs) 2 and one each at Aldershot, Canterbury Halifax Lichfield and Preston Three soldiers' children were also admitted one each at London Parkhurst and Woolwich

---

The twenty eighth annual exhibition of scientific instruments and apparatus, arranged by the Physical Society will be held at the Imperial College of Science and Technology Imperial Institute Road South Kensington S W 7 on January 4 2 30 to 9 p m January 5 4 to 9 p m January 6 2 30 to 9 p m Admission to the exhibition is by ticket only Members of institutions and scientific societies may obtain tickets from their secretaries tickets may also be had direct from the Exhibition Secretary 1 Lowther Gardens, Exhibition Road S W 7

the scientific contraceptive

MIL SAN is submitted to members of the medical profession who are interested in the control of conception, in the firm belief that it is the most effective contraceptive produced in the light of present-day medical knowledge Further that it is non injurious, unobjectionable and hygienic in use and simple to apply

A booklet and medical specimen pack are sent, on request, to members of the profession Information regarding the basis of the formula, the ingredients, the tests made and the action and behaviour of the product are set out fully, while the specimens sent demonstrate clearly the simplicity and advantages of the application method

There are no contra-indications to the use of MIL-SAN with a dependable condom or a properly fitted occlusive pessary It is only by such combined use that the consequences of misuse of one or other of the methods can be minimized and the maximum practicable security obtained

MIL-SAN

Please write name and address plainly or send card or note heading when requesting particulars and specimen tubes

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the protocarbonate of iron The preparation has none of the disadvantages of Pil Blaud. The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided.

The 'Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test.
The Iron 'Jelloid' Co, Ltd, King George's Avenue, Watford Herts

Medical News

The House of the British Medical Association, including the Library, will be closed for the Christmas holiday from 4 p m on Friday, December 24, to 9 a m on Tuesday, December 28 (Library 10 a m)

The House and Library of the Royal Society of Medicine will be closed for the Christmas holiday from Friday December 24, to Monday, December 27, both days inclusive The Library will be closed on December 28 also

The first annual dinner of the newly formed London-Manchester Medical Society will be held at the May Fair Hotel Down Street W 1, on Thursday, January 20 at 7 45 p m Tickets are 12s 6d each, and inquiries should be addressed to the secretary, Mr Albert Davis, F R C S, 93 Harley Street, W 1, from whom further particulars can be obtained

The annual congress of the Ophthalmological Society of the United Kingdom will be held in London next year at the house of the Royal Society of Medicine on April 28–30 The opening discussion will be on the "Differential Diagnosis of the Causes of Exophthalmos"

The December issue of the *Journal of the London Society* (Lancaster House, St James s, S W 1, price 1s) contains the text of an address on The London Hospitals Past, Present and Future," delivered by Mr C E A Bedwell, House Governor of King s College Hospital

To the July–September issue of the *American Anthropologist* T Wingate Todd contributes an article on "The Scientific Influence of Sir Grafton Elliot Smith"

In an article on Medicine in England in 1837," contributed to the October issue of the *American Journal of Surgery* J Hamilton Crawford writes about the leading medical journals of the time

The *Cliftonian* in its October number published a tribute to one of its most distinguished old boys who have adorned the surgical fraternity—Sir Percy Sargent This pious tribute was paid by his familiar friend at St John s College, Cambridge, Mr L G H. Horton-Smith who like his brother, Sir Percival Horton-Smith Hartley, their father, and other members of this distinguished family, was a Fellow of the College In 1892 Percy Sargent s classical friend addressed him in Latin, and two years later celebrated his twenty-first birthday in Latin verse These forty-year old pearls of speech, which recall the compliments of a past age, have now, by the request of the *Cliftonian* been reproduced with the gifted author s translation into the vulgar tongue

The council of Epsom College will shortly elect a girl to a St Anne s Scholarship of £30 per annum Candidates must have been not less than nine years of age on July 1 1937, and must be orphan daughters of medical men who have been for not less than five years in independent practice in England or Wales Application must be made on a form to be obtained from the secretary of the College, 49 Bedford Square, W C 1, and must be returned to him, duly completed, not later than January 15, 1938

At the annual meeting of the Royal Surgical Aid Society at the Mansion House, London, on December 7 it was announced that the amount received last year in subscriptions and donations had been £54,000 Lord De La Warr proposing a vote of thanks to the treasurer and committee of management, said that he was glad to have this opportunity on behalf of the Government to pay tribute to the magnificent work of the Society, which was regarded as a vital link in the health services of the country

Up to the time of going to press the number of known or suspected cases of typhoid fever in the present outbreak at Croydon was 278 with 23 deaths

Miss Helen Simpson visited the Children s Heart Home at Lancing, Sussex, on December 8 to open a new nurses' home the building of which was begun after a broadcast appeal by Miss Simpson last year The institution now requires £1,000 to clear itself of all debt on the new building

The eighteenth salon of doctors, dentists, pharmacists, and veterinary surgeons will be held at 'La Nouvelle Galerie de Paris, 212, Faubourg Saint-Honoré, from January 30 to February 13, 1938 Further information can be obtained from Dr Pierre Bernard Malet, 46, rue Lecourbe, Paris 15e

Sir John Thomson-Walker, the eminent urological surgeon who died on October 5, left estate of the gross value of £184,774, with net personalty £170,850 He bequeathed to the University of Edinburgh (where he was a student), 'in the hope of encouraging the study of the history of medicine, on which this great medical school has had such a profound and lasting influence, his collection of engraved portraits of British and foreign medical men, numerous books, and £500 to provide accommodation for the prints

Dr Allan Bigham has been appointed honorary dermatologist to the newly created skin department of the Bradford Royal Infirmary

Dr Charles S Curtis, a graduate of Harvard Medical School, has been appointed medical superintendent of the hospitals and schools conducted on the coasts of Labrador and Newfoundland by the International Grenfell Association

Dr Albert Mouchet has been elected vice-president of the Association Française de Chirurgie and to hold office as president of the congress in 1939, Dr Imbert of Marseilles being president for 1938

Dr Franz Volhard, professor of internal medicine at Frankfurt, has recently been awarded the Billroth medal by the Medical Association of Vienna

The honorary degree of Doctor of Science was recently conferred on Dr Alexis Carrel of the Rockefeller Institute for Medical Research at the annual convention at Albany of the University of New York State

One hundred years ago Marie Jean Pierre Flourens, Professor of Comparative Anatomy at the University of Paris, localized the respiratory centre (nœud vital) in the medulla oblongata Legallois had come very close to its discovery in 1812

Sir Charles Wyndham, actor manager and founder of the Wyndham Theatre, the centenary of whose birth occurs this year, studied medicine in London and in Dublin and served as a surgeon in the American Civil War His original name was Charles Culverwell He died in 1919

To commemorate the centenary of the birth of Charles Frederick Chandler, New York s first public health chemist (December 6, 1836), Dr Haven Emerson on October 20 gave an address at Columbia University

Announcement is made of the forthcoming publication of an *Annual Review of Physiology* in which it is proposed to survey once a year the developments of the preceding year or biennium in the major fields of physiological research The series will appear under the auspices of the American Physiological Society, Inc, and the Annual Review of Biochemistry, Ltd, Stanford University California The new review will conform in general style and format to the *Annual Review of Biochemistry* Dr J Murray Luck is the managing editor The first volume is expected to appear in February, 1939

Sir Andrew McPhail professor of the history of medicine at the McGill University faculty of medicine, has retired from his chair

QUERIES AND ANSWERS

Apex-beat and Chest Measurements in Children

Dr FRANK C EVE (14 Albion Street, Hull) writes Could any of your readers kindly help me in an investigation I am carrying out on the above relationship? What my paper needs is a record of the growth of chest girth and of the apex beat to mid line measurement in small children which has been carried out annually for five or ten or fifteen years They should be normal children but of course, the influence of an intercurrent illness would add interest. The record of even one child through a term of years would be worth publishing but numbers would be much better The only hope seems to be a medical parent or the doctor of some public or private school

Painful Tongue

"WORRIED" writes Perhaps some of your readers could advise me as to the treatment of a female patient, aged 50 who for the past two years has been suffering from pain in the tongue "like burning pins and needles The gums and buccal mucous membrane are also affected. There is nothing abnormal to see or feel. Analgesic mouth washes progynon vitamin B therapy iron and arsenic etc have been tried without avail. The general condition is fair and the blood count normal.

Natural Sunlight and Ultra-violet Light Therapy

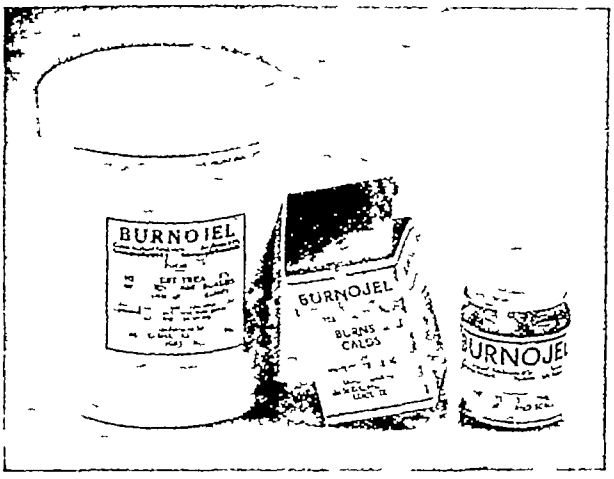
Dr WALTER P KENNEDY (Royal College of Medicine Baghdad) writes Dr R A. Johnson's letter (*Journal* November 6 p 946) on the possibility of screening sunlight for therapeutic use in Southern India raises a question which is not easy to answer as so many variables are involved In the first place it is by no means proved that only the ultra violet fraction of radiation is therapeutically effective and indeed this idea is probably erroneous Saleeby insists that visible light rays seem to have special anti-infective powers and believes that it is the whole of solar radiation as it reaches us which is physiologically impor tant At the Finsen Institute they believe that the sun is unquestionably the best source available Phelps (1930 *J Bone and Joint Surg* **12** 253) pointed out that marked improvement in extrapulmonary tuberculosis was obtained at seaside sanatoria as well as in the Swiss Alps and while there is considerable short wave ultra violet light in the latter situation the absorption of short ultra violet rays in the former is very great Few observations have been made on ultra violet radiation in the Tropics, especially with reference to therapeutic properties Marsh (1931 *Medical Report of the Anglo-Persian Oil Company*) work ing in Southern Iraq, where the annual mean shade tem perature range is from 66 4° F to 116 F has made some measurements with the oxalic acid-uranium acetate method He says that to obtain one erythema dose from the ultra-violet component of sunlight there would entail exposure of the naked skin to the sun on a bright day of (*a*) half an hour between 10 a.m and noon in the months of April to August (*b*) two hours between 7 a.m. and 9 a m in the months of April to August (*c*) four hours between 8 a m. and noon during the first half of February Observa tions of a slightly different type made at the Royal College of Medicine Baghdad give a general support to this report. Physicians in the Tropics interested in the ultra violet com ponent of sunlight could make valuable additions to know ledge by making measurements both day by day and hourly on occasional days. Accurate radiometric measurements are the ideal but they are difficult to make and are expensive Useful results however can be obtained by simple means the oxalic acid-uranium acetate method, described by Freer and Gibbs (1932 *J Phys Chem* **16** 709) the nitrite method mentioned by Walker (1937 *Analyst* **62** 667) and Owen's (1935 *Lancet* **2** 589) instrument, which costs £7 10s The last named is particularly adapted to long period investiga tions and takes but a minute to read daily The methylene blue method is widely used but is not to be recommended Both direct solar and diffuse sky radiation should be measured When the altitude of the sun is low the ultra violet part of sky radiation considerably exceeds that of the direct sun. Dr Johnson refers to the high proportion of infra red rays at his station. The special importance of this can be seen in the emphasis Sundstroem (1926 *University of California Publications Physiol* VI 1) lays on the existence in tropical regions of a continuous reduction of the capacity of the body to cool off Without data on the relative humidity at Golden Rock one cannot estimate to what extent this is operative Kata thermometer measure ments would be most illuminating My experience in Baghdad is that with the temperature at 110 F and the relative humidity approximating 15 to 18 the conditions obtaining in July and August it is possible to sit stripped near a bathing pool from 10 a m to noon and even longer without ill effect. How advisable this practice is one hesitates to say but it is quite common to European residents

Incapacitating Diarrhoea

Dr ALEXANDER FRANCIS writes Emdee's morning diar-rhoea is undoubtedly a vasomotor disturbance Not infre-quently such attacks of diarrhoea are found to alternate with headache asthma and vasomotor rhinitis, but some-times diarrhoea is the only symptom. Ordinary intestinal remedies are useless, but as soon as the vasomotor system is made stable the trouble will disappear

Income Tax

Proportion of General Expenses



M S carries on his practice mainly from a surgery apart from his house but the latter is used for emergencies calls out of hours private appointments, etc The house has eight rooms of which four are on the ground floor The authorities will not allow more than one third of the running expenses of the house and of the maid's wages Is that reasonable?

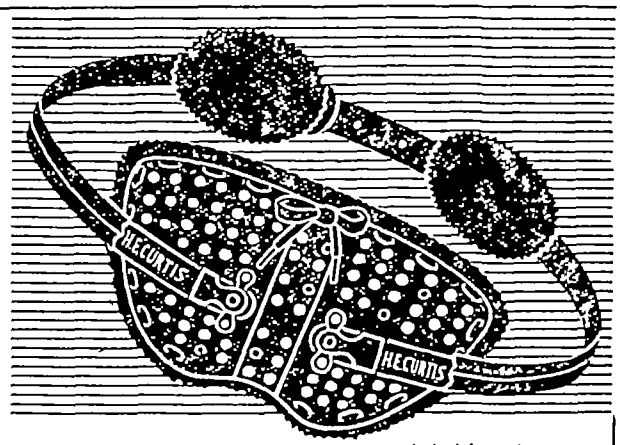
*** We could not advise M S to take his claim for a higher ratio to appeal If the surgery had been on the premises so that the general expenses would have included the cost of surgery cleaning and attendance one half would be the normal ratio Seeing that the specific surgery running costs are separate and deductible as such the ratio of one third of the general expenses would seem adequate to cover the professional element in those expenses.

Proportion of General Expenses

"SALOPIAN S" household consists of himself an indoor assistant a married couple (cook and gardener-chauffeur) and a maid The inspector of taxes has allowed three-fifths of the rates heating, lighting, etc (the surgery is in the house) and the *wages* of the cook, maid, and half those of the manservant. He has allowed 30s per week for the food of the assistant, but nothing for the keep of the servants as he considers the wages deduction sufficient to cover all the professional expense

*** The circumstances are not usual—no family and the assistant living in—and no specific practice can be shown to

It is gratifying to record an instance of burns of the third and fourth degree which have responded to an unusual extent to a novel therapy The case was that of injury from boiling water embracing the lateral crural area from the knee to and including the anterior pedal aspect At the perophery of trauma large bullae were intermingled with folds of necrotic epithelium In the middle longitudinal or fibular axis the cutis vera was destroyed Treatment was begun in hospital soon after occurrence The bullae were incised and necrosed skin removed A thin layer of copper guaiacol sulphonate with acriflavine was applied and covered with sterile strips of gamgee The patient who had shown much fortitude declared her pain relieved and was discharged The copper guaiacol sulphonate known commercially as Burnojel is easily spread by a bone spatula Unlike tannic acid in its many forms of preparation this chemical produces no dark scab



BURNOJEL for burns and scalds

This treatment for burns scalds etc constitutes a marked improvement on tannic acid Healing is accelerated by the inclusion of copper guaiacol sulphonate The medical prices for Burnojel are 1/4 per small jar and 7/6 per lb jar but send to us in the first place for a testing sample

Burnojel is manufactured by A de St Dalmas & Co, Ltd
Head Office Leicester London Depot 56/58, Clerkenwell Road

A Triumph of Emulsification

THE OILY RING AROUND
THIS DROP TELLS THE STORY

The ring around the drop tells the story A drop of Agarol on blotting paper holds firmly together Try this with a poor emulsion and you will soon see the mineral oil being taken up by the blotting paper, forming a greasy ring around the drop

For dependable efficacy in the treatment of constipation and allied disorders Agarol — mineral oil, agar-agar and phenolphthalein emulsion — has attained a reputation all its own

Only the finest and purest ingredients are used in Agarol Its exceptional palatability, secured without artificial flavouring, renders it acceptable to both children and adults Agarol contains no alcohol and no alkali and, being devoid of sugar, is particularly suited to diabetic cases

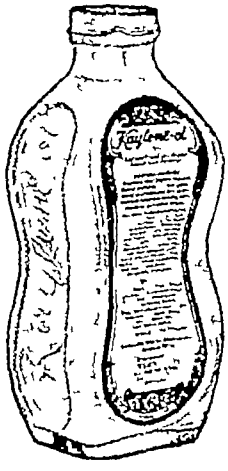
Agarol
BRAND COMPOUND

FOR CONSTIPATION

Supplied in bottles containing 4½, 7½ and 17 ounces

Agarol is not advertised to the public

William R Warner & Co Ltd , Power Road, Chiswick, London, W 4



Practical Applications of the

KAYLENE-OL

Treatment

CHRONIC COLITIS

(Simple Mucous, Muco-Membranous, Post-Dysenteric)

aylene Brand of Colloidal Kaolin
th highly viscous liquid paraffin)

Alternating intervals of constipation and diarrhoea often occur in cases of colitis Kaylene ol is applicable in either phase Its soothing and adsorptive actions combat the irritative diarrhoea, and its softening and lubricating actions counteract constipation during the intervals

DOSE—KAYLENE-OL 1 or 2 dessertspoonsful three times a day, half hour before meals, or in mild cases half hour before breakfast and at bedtime

Kaylene-ol c Phenolphthalein (0 5 per cent.) is taken when constipation is particularly troublesome. Dosage as for Kaylene-ol

Samples and Literature from the sole manufacturers

TWENTY-FIVE per cent. of the flour from which the HOVIS loaf is produced is wheat germ

Science advocates the use of germ-bread as a factor in promoting nutrition That is why HOVIS figures so prominently upon the dietary when the question of food value must be studied In white bread, the wheat-germ is practically non-existent This vitalising source of protein, fats and phosphates abounds in HOVIS In fact, twenty-five per cent of the flour from which the HOVIS loaf is produced, is WHEAT-GERM Apart from its low starch-content, HOVIS is practically free from bran and indigestible cellulose This factor makes HOVIS supreme for easy digestibility and assimilation

VITAMIN 'B' CONTENT : HOVIS 2,600 WHOLEMEAL 1 450 WHITE BREAD 200

for RELIABILITY

'VARIBAN' ELASTIC PLASTER BANDAGE

VARIBAN BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg It is made from a specially woven selvedge material possessing highly elastic properties, and is impregnated with an antiseptic zinc oxide paste.

VARIBAN is self adhesive and combines the principles of firm equable pressure and support to the swollen leg with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair

In promoting proper circulation VARIBAN steadily reduces oedema It provides protection to the granulations of the healing ulcer In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application The necessity for ointments lotions etc. is obviated while VARIBAN provides an ambulatory treatment which allows of full activity of the limbs with better results than those following rest in bed alone

COLLOSOL IODINE

The importance of iodine as a constituent of the blood cannot well be over-estimated, and the activities of the thyroid gland are known to be associated with the presence of this element

The use of Collosol Iodine in such a variety of conditions as Arthritis, Rheumatism, Fibrositis, Hypertension, Ringworm, Enlarged Glands and Goitre, Sinuses, Actinomycosis, Venereal Disease, Puerperal Fever, Iodine Deficiency, Gynæcology, the Pneumonias, etc, etc, has been the subject of over 60 favourable clinical references in authoritative medical journals

A special monograph will be forwarded on request

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test.

MILTON PROPRIETARY LTD.

CHAIRMAN'S SPEECH.

The Fourteenth Ordinary General Meeting of Milton Proprietary Limited was held at John Milton House London N 7 on the 16th December 1937

The Chairman Mr H S Clough said —

You will observe from the Accounts that the profit for the year of £46 736 approximates to the profit for the preceding year of £47 564 The gross profit on trading for the year is £52 030 contrasted with £53 228 for the preceding year The Current Assets of the Company comprising its Stock Debtors and Cash with Building Societies and Bankers total £114 822 whereas its Creditors including the reserve for Income Tax amount to £30 070 After deducting this latter sum and the amount of the provision for the Final Preference Dividend of £2 596 there is an excess of liquid resources over liabilities of £82 156 The position thus disclosed is considered as highly satisfactory particularly as the total of Cash at Bank and on deposit with Building Societies is no less than £74 000

The business of the Company is conducted in a field of commercial activity in which there is much competition and this competition has been somewhat intensified during the current year It is very satisfactory to record that the Company's position has been well maintained and its trading results are shown at about the level of last year notwithstanding the fact that the new Milton Denture Powder was introduced only five months before the end of the financial year under review and a substantial proportion of the expenditure associated therewith has been included in the Accounts The Milton Denture Powder has been well received by the public and the Dental Profession, and we are satisfied that our laboratories have produced after extensive research a powder that is worthy in every way of the Company that was the pioneer in this particular field of oral hygiene Its rapid cleansing and sterilising properties are receiving widespread recognition Already several thousand dentists have expressed unqualified approval of the Milton Denture Powder—it is undoubtedly the best product of its kind on the market

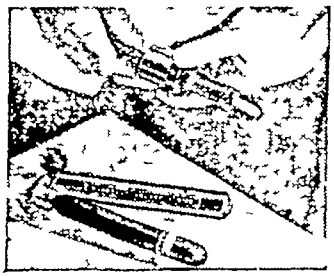
I am glad to be able to report an increasing knowledge by the public of the unsurpassed antiseptic qualities of the Milton fluid which has for many years been the principal product of your Company There is no other germicide or antiseptic available to the public which is as efficacious and which possesses such valuable properties Its superiority is evidenced by pathological tests which establish it as a real germ killer it is the strongest antiseptic for personal use available to the public being more than 80 times as powerful a germicide as a Carbolic (5%) Solution and notwithstanding this it has the unique advantage of being absolutely safe and non poisonous No household should be without a bottle of Milton particularly in view of the multiplicity of uses to which it can be safely put as an antiseptic fluid and germ destroyer Fortunately no question of expense need limit the use of Milton It is relatively cheap to purchase and its great germ cidal strength enables it to be used in small quantities

Publicity has been given in the Press recently to the chlorination of water supplies as a means of eliminating the typhoid germ The same effect can be obtained domestically by the addition of a small quantity of Milton fluid to water since Milton is an antiseptic of the hypochlorite class If water treated by Milton is allowed to stand for a few minutes all taste will quickly disappear and there is the additional advantage that there is no need to indulge in the further process of sterilising the water by boiling This is a simple illustration of the superiority of Milton as a germ destroyer

The Milton Ointment which is a compound of chemically pure ingredients prepared in clean and hygienic conditions carries a high percentage of the Milton fluid and thus possesses valuable healing and cleansing properties

The Company also produces a high class Dental Cream which is in all respects equal to competitive products on the market. despite the fact that it is sold at a moderate price

The Milton Antiseptic Fluid the Milton Denture Powder Milton Ointment and the Milton Toothpaste are high grade toilet and household requisites which can be purchased at reasonable cost, and there are no other products superior to these products or more effective for the purposes for which they are prescribed



The Directors Report and the Accounts were adopted and a final dividend of 17½% less Income Tax making with the interim dividend of 7½% less Income Tax, already paid a dividend at the rate of 25% less Income Tax was declared

HOW IMPORTANT
ARE MINERALS IN THE DIET?

They are absolutely essential for the maintenance of an adequate state of nutrition However, not infrequently an apparently minor mineral deficiency may weaken the body's defensive mechanism to such a point that

Pregnancy, Infection, or any other unusual tax

may lead to a prolonged period of convalescence.

COMPOUND SYRUP OF HYPOPHOSPHITES

TRADE **"FELLOWS"** MARK

The following are extracts from a few of the doctors' letters received during 1937

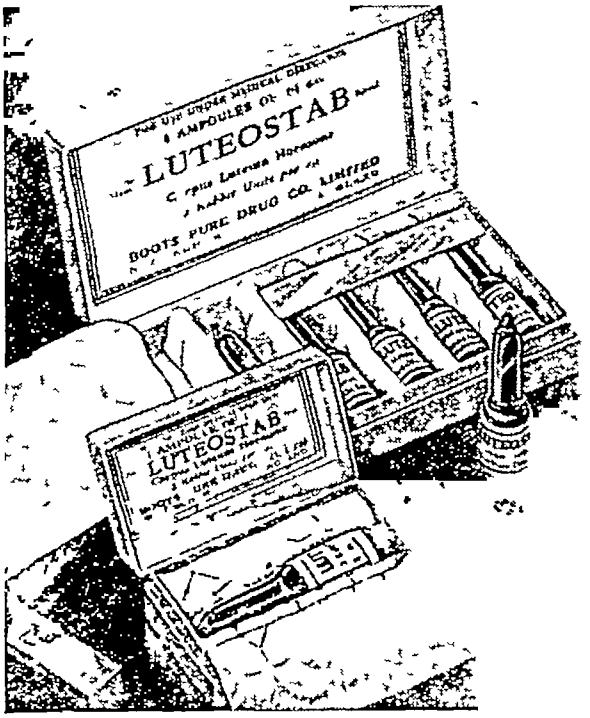
A LONDON DOCTOR: *I find it most excellent for marasmic and rickety children*

A NEWCASTLE-ON-TYNE DOCTOR *I use it for my two sons who are growing rapidly and appear to have maintained their general nutrition better at this stage since taking NUMOL*

A BIRMINGHAM DOCTOR. *The amount of good it does must be sufficient advertisement judging by the number of patients who have asked me to obtain supplies for them*

A NOTTINGHAMSHIRE DOCTOR. *I have found NUMOL extraordinarily good*

A SURREY DOCTOR *I have had very good results with NUMOL recently, in post-influenzal debility particularly*



A DURHAM DOCTOR *I always recommend NUMOL*

A GLAMORGANSHIRE DOCTOR *During the past month I have been prescribing NUMOL for a patient who has gained 4¼ lbs in four weeks*

NUMOL

IS VALUABLE IN CASES OF POST-INFLUENZAL DEBILITY

Doctors who have not had a sample are asked to write to Numol Limited, Elswick Road, Newcastle-on-Tyne 4

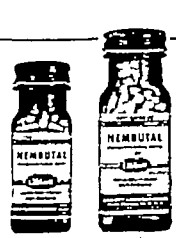
MORE THAN 200 PUBLISHED REFERENCES



During the six years since its introduction, Nembutal has been the subject of more than two hundred reports and references in medical literature This record is important not only as an indication of the profession s interest, but also as evidence of the extensive clinical investigation to which the drug has been subjected • Today, its uses and advantages as well as its limitations are well understood, and the practitioner can make use of Nembutal with full confidence in its safety when administered, as recommended • Used orally, rectally or, in emergencies, intravenously, Nembutal exerts an extremely rapid but brief hypnotic and a pronounced sedative action from a dosage only about one-half that of most other powerful barbiturates This small dosage, by lessening the amount of the drug to be eliminated, makes Nembutal, clinically, one of the safest of the barbiturates • Safety, rapidity and brevity of action recommend Nembutal for use as a pre-anæsthetic sedative in both major and minor surgery, as well as for the treatment of insomnia, hysteria, sea-sickness, nausea from any cause, eclampsia, delirium tremens, convulsions from strychnine or other poisoning, as a supplement to morphine in controlling the pain of early cancer and in obstetrics • Nembutal is available in a wide variety of forms, the most widely employed of which are the ½-grain and 1½-grain capsules for oral administration Comprehensive literature, together with a free trial sample of the 1½-grain Nembutal capsules, will be sent upon request.

This pure, unsweetened Dole Pineapple Juice packed in vacuum-sealed tins is

HIGH IN NUTRITIONAL CONTENT

YOU can always count on unvarying quality and goodness in Dole Hawaiian Pineapple Juice And the exclusive Dole Fast Seal Vacuum Packing Process preserves to a high degree the *desirable fresh fruit constituents* As a result, whenever your patients open a tin of Dole Hawaiian Pineapple Juice they are greeted by a tropical aroma, by a tangy flavour of juice that is unvaryingly delicious.

The original Hawaiian pineapple juice Dole juice, has received the Seal of Acceptance of the American Medical Association's Committee on Foods. It not only contains important fresh fruit elements, but is a natural source of vitamins A, B, and C

J K. Husband & Co , Ltd , 10 Eastcheap, London, E C.3

PREPARING FOR A LUAU NATIVE FEAST— There are lots of preparations to be made before the luau is ready to be served. The poi must be pounded the pig cooked in the imu—under ground oven, pineapples, bananas, and other fruits are gathered squid and fish must be caught on the reef, and the ti leaves gathered from the mountain side, in which to wrap the food and also to serve as covering for the table

To the happy Hawaiian there is almost as much pleasure in all these preparations as in partaking of the delicious feast.

Here is a typical analysis of Dole Pineapple Juice :

Moisture	85 3%
Ash	0 4
Fat (ether extract)	0 3
Protein (N x 6.25)	0 3
Crude fibre	0.02
Titratable acidity as citric acid	0 9
Reducing sugars as invert sugar	12.4
Carbohydrates other than sugars (by difference)	0 38

P S. If you will drop us a line on your letter-head we will be glad to send you a free sample tin of Dole Hawaiian Pineapple Juice, the perfected pineapple juice

MULTIVITE

(*Vitamins A B₁ C and D*)

The deleterious effects resulting from a general all-round vitamin deficiency are not always sufficiently apparent as to permit of exact diagnosis, they are, nevertheless, often of so serious a nature as to cause a condition of general malaise and subnormal health Effective prophylactic measures are ensured by the daily administration of Multivite, its valuable content of Vitamins A B_1 C and D exerting a far-reaching beneficial influence on health and well-being

The Vitamin A in Multivite fulfils the important function of maintaining the integrity of the mucous membrane, Vitamin B_1 prevents the accumulation in the tissues of pyruvic and lactic acids and the consequent impairment of nerve function (such impairment playing an important part in many forms of neuritis) Finally, there are Vitamin C (the anti-scorbutic vitamin) and Vitamin D (the anti-rachitic vitamin), each of which fills an important role in the maintenance of physical fitness

Multivite is presented in the form of a palatable pellet, being particularly convenient for administration to adults

Concentrated

Anti-Meningococcus Serum (Group II)

(Globulin Solution)

The serum therapy of infections caused by group II organisms is often less successful than the specific treatment of group I infections due to types 1 and 3, which are usually associated with epidemics of cerebrospinal fever Accordingly, a group II serum has been specially prepared at the Serum Department of the Lister Institute This serum has been subjected to a process of concentration so that a large proportion of the inactive proteins has been removed, the dose of antibody is thus contained in a smaller volume of fluid.

Three preparations are issued in concentrated form

(1) Anti-meningococcus serum (multivalent)

(2) Anti-meningococcus serum (Group I)

(3) Anti-meningococcus serum (Group II)

Anti-meningococcus Serum for Diagnostic Purposes

Particulars with regard to these sera are obtainable from

HEADACHE IS DISABLING

Headache may be as disabling as a grave illness In migraine particularly, the headache is of all degrees of intensity, at times so severe as completely to incapacitate the sufferer It is noteworthy how quickly the patient can obtain relief with Veganin Composed of minimum doses of acetylsalicylic acid, phenacetin and codeine, Veganin affords striking proof of the superior analgesic potency of this synergistic alliance over that of its components administered separately Recurrent painful conditions, such as migraine and dysmenorrhœa, yield with impressive promptness to the efficacy of Veganin

VEGANIN Brand Tablets are supplied to the public in tubes of 10 and 20 containers of 100, 500 and 1,000 for the Medical Profession only

Convalescence

In convalescence a tonic is required that will co-operate with, and augment, the natural recuperative powers of the body, rather than one which will have only an immediate stimulating effect In the latter case there is always the danger of disappointment, due to an artificial improvement that the natural powers are unable to stabilise

Medical evidence extending over many years has established the value of Sanatogen in promoting convalescence In "The Elements of Pharmacy, Materia Medica and Therapeutics", Sir William Whitla writes —

> "*The interesting and valuable researches conducted by Tunnicliffe and Beddoes upon metabolism, in which Sanatogen was experimented with, establish the fact that its organic phosphorus is almost entirely assimilated when the food is administered in the amount necessary for the needs of the body When given in addition to other food, the amount of nitrogen and phosphorus retained in the organism is increased, the tissue metabolism is more complete, the constituents of the ordinary food being more thoroughly utilised appetite is increased and the body weight augmented*"

Similarly gratifying observations are constantly being notified, and, as Sanatogen is entirely free from fats, sugars and carbohydrates, it can safely be prescribed in all types of cases. It is rapidly and easily digested and assimilated, even in cases exhibiting severe gastric inflammation, and for this reason it is a valuable addition to enemata It can be added to any non-acid beverage or food, and, consequently, monotony in its administration can always be avoided.

SANATOGEN

A CHEMICAL COMBINATION OF 95% MILK CASEIN AND 5% SODIUM GLYCEROPHOSPHATE

Clinical samples and literature available on request to

GENATOSAN LTD, LOUGHBOROUGH, LEICESTERSHIRE

DOSAGE: For children and adults two teaspoonfuls three times daily or according to circumstances. For infants ½ teaspoonful added to each bottle feed.

Sold by all chemists price 2/3 to 19/9

MANDECAL

(Compound Calcium Mandelate B D.H)

For the treatment of Urinary Infections

Mandecal is a pleasantly-flavoured preparation of pure calcium mandelate in powder form Being readily miscible with water Mandecal is simple of administration, it is therapeutically effective, and its administration is not followed by any dyspeptic discomfort such as that which occasionally occurs during protracted treatment with other mandelic acid preparations

Mandecal is available in bottles containing 130 grammes, sufficient for treatment lasting seven days

Sample on request

TUBERCULOSIS IN HOSPITAL WORKERS*

BY

PETER W EDWARDS, M B, Ch.B

Medical Superintendent Cheshire Joint Sanatorium

It is perhaps a little previous to enter upon a discussion on this subject, because we are without important facts We are promised data at the end of the year from the Registrar-General concerning tuberculosis in nurses as compared with other women of the same age and many of us feel that the figures are going to show a heavy incidence of tuberculosis among nurses At present we are relying more upon experience than upon facts and experience to experience oft opposed leaves truth uncertain A certain amount of work concerning pulmonary tuberculosis in nurses and doctors has been done particularly in America and Norway and a beginning has been made in England Hospital porters and orderlies do not appear to have been followed up and so this paper will deal in the main with nurses.

Incidence among Nurses in General Hospitals

Most of the work published is hardly applicable to conditions that prevail in England. Let us however review very briefly as has been done in the Milroy Lectures, 1937 and in the report to the Joint Tuberculosis Council, Tuberculosis among Nurses, what has been said on the subject I have freely extracted from these and from the fourth report of the Joint Tuberculosis Council on "Care and After care Schemes in Tuberculosis"

In 1903 Theodore Williams made investigations among the Brompton Hospital nurses, but it was Heimbeck's work (1928) that first drew serious attention to the matter In the General Hospital, Oslo where there are tuberculosis wards and where the nursing training lasts four years he found that 12 per cent of all nurses entering developed clinical tuberculosis those with a negative tuberculin reaction being most vulnerable (29 6 per cent of the Pirquet negative as compared with 2.6 per cent. of the Pirquet-positive) His most recent figures (1936) indicate even more positively than before that nurses unprotected by a previous infection—that is who are Pirquet negative on admission—carry a higher liability to contract tuberculous disease.

Shipman and Davis (1933) state that between 6 and 7 per cent of the student nurses in the University of California Hospital numbering 387 over the ten-year period 1922–31 developed clinical tuberculosis during their three years course of training and that an additional 4 per cent of those graduating during that period subsequently developed the disease There are we understand no tuberculosis wards in this hospital The authors found that the majority of the nurses who failed to react o tuberculin on entrance also failed to react on retesting a year or more later They observed no special incidence among the non reactors at entrance

Pollock and Forsee (1935) state that during a period of ten years out of 518 trained nurses serving for varying periods at Fitzsimon s Hospital where there were plenty of possible sources of infection eight developed tuberculosis All the 518 had been classed as tuberculo allergic, apparently on *x* ray evidence alone

Kramer (1934) found that in nursing sisters working in general wards not quite 1 per cent became ill with tuberculosis whereas 16 per cent of those working in tuberculosis wards, even under the best conditions developed the disease Although the numbers are too small to stand by themselves it seems significant that of 225 not working in tuberculosis wards only two were affected while of twenty five working in those wards four developed the disease

Geer (1934) states that from 1920 to 1928 the records of the nurses training school at Ancker Hospital St Paul (a general hospital with sanatorium wards) showed an incidence of 4 5 per cent of tuberculous disease among its nurses—that is three times the normal expected incidence among young women of the same age group From September 1925 to September 1930 112 young women entered upon training, and of these 5 5 per cent —that is 2 75 per cent per annum—developed tuberculous disease On the latter date a strict aseptic technique was instituted after which only 1 6 per cent of 181 new entrants developed clinical tuberculosis The period of observation was from September 1930 presumably to June 1932 This aseptic technique involved the wearing of masks skull-caps, and overalls with a sharp demarcation of infected from uninfected accommodation and careful scrubbing of hands and changing of overalls etc whenever the nurses moved from infected to uninfected rooms

Geer found that on the average 30 per cent were tuberculin positive on entrance and close to 100 per cent reacted before training was completed He compared the incidence of tuberculosis among the nurses in five other hospitals in St Paul In these although 42 per cent were tuberculin positive in the third year of training no cases of tuberculous disease were encountered in the two-year period reviewed In the next two years however these hospitals showed an incidence of 1 per cent of tuberculosis Most of Geer's cases of tuberculosis were non reactors on entrance. Mucke (1926) over a period of thirty-seven years found that of 4,254 nurses and nuns 150 developed tuberculosis of whom twelve died Up to 1918 the percentage incidence was 1 subsequently it was 4 6 The disease usually developed in from three months to two years after entrance

* Read in opening a discussion in the Section of Tuberculosis at the Annual Meeting of the British Medical Association Belfast, 1937

DIPHTHERIA PROPHYLAXIS

A P T (EVANS)

In groups of children (up to 8 years of age) when the Schick negative rate is high, one dose will produce immunity in 90-95 per cent of the cases

When the negative rate is generally low, the almost complete immunity of a group can be attained by injecting 0 1 c c followed by 0 1 to 0 5 c c three or four weeks later

T A F. (EVANS)

Has about 97 per cent immunising efficiency Three doses are necessary, each of 1 c c., administered at intervals of one week or preferably two weeks Of all the Diphtheria Prophylactics, T A F is the least likely to cause reactions and is indicated, therefore, for older children and adults

Literature dealing with Diphtheria Prophylaxis will be sent to physicians on request

Incidence in Tuberculosis Hospitals

Ross of the Manitoba Sanatorium (1930) and Carmalt Jones of New Zealand (1933) also accept the view that tuberculosis is unduly prevalent among nurses J S Whitney (1935) gave a review of the recent literature on the subject The experience at Vejlefjord Sanatorium is quoted in *Tubercle* (September, 1935, p 562) During the period 1914–34, out of 645 sanatorium employees twenty seven developed tuberculosis while they were working there Three of the five lift-boys and twenty-two of 404 persons employed in the wards in various capacities developed tuberculosis, whereas no case arose among the hundred kitchen workers Two of the laundry and dining-room staff became affected Contrast with this a hydropathic establishment not taking tuberculous cases, where in the five year period 1929–34 there were 635 employees, only two of whom developed pleurisy One of them had recently served in a sanatorium

Gullbring (1936)—quoted by Lillingston—states that from 1918 to July, 1935, in the tuberculosis hospital of Soderby, Sweden, forty-five cases of tuberculosis occurred among a staff of 2,016—that is, 0 2 per cent The rate was 2 6 per cent among staff coming in contact with patients but only 1 per cent among others The incidence in negative reactors was three times that in positive reactors In at least one Swedish hospital tuberculin negative entrants are now being inoculated with B C G

On the other hand, it is commonly believed in this country that the incidence of tuberculosis in nursing staffs is lower in sanatoria and tuberculosis hospitals than in general hospitals, as the experience at the Brompton Hospital, already referred to, suggests In America Baldwin (1930) states that no case of pulmonary tuberculosis has been known to develop among many hundreds of healthy employees at the Trudeau Sanatorium during forty-five years In Germany Aufrecht, quoted by Clark (1934), found no case during seventeen years among 263 nurses and attendants in a general hospital where 10 per cent of the patients were consumptives

In 1936 Mariette produced a paper dealing with the rate of infection of nurses in various hospitals, in which he compares the incidence of breakdown in tuberculin-negative nurses He points out that the tuberculin-negative nurse runs a very much greater risk than the tuberculin-positive This supports the findings of Heimbeck, and so also in a small way does the series at the Cheshire Joint Sanatorium D Arcy Hart (1937), in the Milroy Lectures, discusses the question very fully, particularly the matter of tuberculosis in medical students, and makes many valuable suggestions

It is significant in the investigations that are being carried on that in some hospitals the tuberculin negative people become tuberculin-positive within a short time, whereas in other hospitals long intervals occur, and not all the tuberculin-negative nurses become tuberculin-positive The same is possibly true of medical students and of hospital porters—for example, a porter at the Cheshire Joint Sanatorium who is continually carrying patients is still tuberculin negative after nineteen months service

There is a strong impression among medical superintendents in the sanatorium world that very few nurses contract tuberculosis in a sanatorium, and yet it is forced upon the same men that a large number of nurses are admitted to sanatoria from other hospitals There is a growing feeling also that far too many medical students and young medical men break down with tuberculosis I have seen no figures for hospital orderlies or porters However, perhaps one ought to expect an increased number of cases of tuberculosis in the staffs of general hospitals but that the incidence among nurses in sanatoria ought not to be excessive We merely have to consider the fact that the nurses are contacts, and, unfortunately, nurses in general hospitals are often contacts of unknown cases of tuberculosis In a sanatorium they are contacts of known cases, cases that have been educated, and the nurses themselves have been instructed in the method of control

Examination of Contacts

The contact in the home is a very different person from the known contact in a sanatorium or hospital There should be segregation of the case in the home, but in hospitals, particularly in a sanatorium, of necessity we must treat the case and teach those who are carrying out the treatment The unknown case of tuberculosis will always be a danger The fact that in England to day one might walk up to a constable and spit under his nose and get away with it is a revelation of our slackness in dealing with the chief cause of tuberculosis There can be no tuberculosis without tubercle bacilli, and there cannot be many tubercle bacilli when the heinousness of coughing and spitting indiscriminately is realized and abolished To-day much is being made of the danger from tuberculous milk, too little of the gravity of spitting

Again, contact examination has proved that the young adult is far more susceptible to tuberculosis than children, so the interest in contact examination has rightly been transferred to the young adult That nurses, medical students, porters, etc, are contacts need not be unduly stressed, as we believe that if people know what to do and the patient is taught what he has to do the chances of infection from pulmonary tuberculosis are extremely small In other words, from an educated consumptive a well-fed, well-housed, properly conducted nurse is not likely to contract pulmonary tuberculosis

A fact of importance, and one that should be emphasized, is that the nurse or medical student who does happen to develop pulmonary tuberculosis will usually be diagnosed very much earlier, and therefore the chance of recovery is infinitely greater This is especially true when such personnel are considered as contacts and examined regularly as a routine Tuberculosis as an infection in the personnel will definitely exist, but as a disease it will be rare, and mere infection most often is harmless

We must remember, too, that the imaginary or the definite high incidence of tuberculosis among medical students and nurses may also be due to the fact that they are quickly examined, and any thorough overhaul of a staff will usually reveal symptomless tuberculosis in certain members—for example, the Metropolitan Life Assurance Company of America found that 0 4 per cent of young adults on their staff had pulmonary tuberculosis, whereas the incidence among young adults in the community generally was only 0 2 per cent

Another encouraging fact, as pointed out by Mariette, is that while the percentage of deaths for all women 20 to 50 years of age on discharge from his sanatorium since January, 1916, is 29 6 per cent, only 5 7 per cent of all nurses who were patients had died of tuberculosis in the same time

PRECAUTIONARY MEASURES

Patients admitted to every kind of hospital should be taught the essential precautions that should be taken to prevent a spread of any germs from their mouth, whether they have tuberculosis or not The precautions are simple and involve the proper disposal of sputum the proper covering of the mouth, and the proper use of handkerchiefs It is equally important, if we are in earnest about the conquest of tuberculosis, that all patients admitted for whatever disease should have a thorough examination of their sputum and a technically satisfactory radiograph of their chest This should be properly interpreted These procedures ought to be as much a routine as the examination of the urine, for tuberculosis is a disease that may be symptomless and

Syrup Cocillana Compound P., D. & Co.

SYRUP COCILLANA COMPOUND (P., D. & Co.) is an efficacious preparation for use in the irritating cough of incipient bronchitis, the winter cough of the aged or in any other bronchial condition in which the cough is excessive and the secretion scanty

Syrup Cocillana Compound (P., D. & Co.) is of pleasing appearance and taste and is readily taken by patients of all ages Unlike most cough syrups it has a laxative rather than a constipating effect

In special circumstances when it may be desirable to prescribe Syrup Cocillana Compound in association with other ingredients, potassium iodide or tincture of belladonna may be added if indicated The salty taste of ammonium chloride is more effectively disguised when prescribed with Syrup Cocillana Compound (P., D & Co.) than in any of the usual combinations

FORMULA

Each fluid drachm contains

Tincture of Cocillana	*5 mins.*
Tinct. Euphorbia Pilulifera	*15 mins*
Syrup of Wild Lettuce	*15 mins*
Fluid Extract of Squill	*½ min*
Fluid Extract of Senega	*½ min*
Tartarated Antimony	*⅛ gr.*
Cascara (P. D. & Co.)	*1 gr.*
Menthol	*⅛ gr.*
Ethylmorphine Hydrochloride	*¼ gr.*

To ensure the original preparation please specify Parke, Davis & Co.' Supplied in bottles of 4, 8, 16 and 80 fluid ounces

Laboratories Hounslow, Middlesex

Inc. U.S.A., Liability Ltd

may be overlooked because of a broken leg, pneumonia, or appendicitis, and until our medical residents and nurses realize this and are taught what to do in the matter of the precautions mentioned we shall get an unwarrantable incidence of tuberculosis but when these methods are adopted there will be a great limitation in the dangers, with a consequent fall in the disease

There is a difficulty in ascertaining the incidence of tuberculosis as contacts do not necessarily get their disease at once There is an unknown interval of incubation which may be anything over three years I do not know of any hospital that keeps a real 'follow up' of its staff, though certain hospitals maintain that they are aware of what has happened to the nurses that trained with them, but inquiries do not seem to justify this claim, and a statement made by certain ladies in high positions in the nursing world that they have never known a case of tuberculosis in their nurses makes one feel that they do not know tuberculosis when they see it

Investigation of Causes of Breakdown

First and foremost investigations in other countries show that the rate of breakdown among nurses in general hospitals is fairly high Ferguson of Saskatchewan reports that 5 14 per cent of all patients under treatment are nurses or nurses in training, and an additional 1 2 per cent are other hospital attendants—that is the incidence of breakdown among nurses in general hospitals in Saskatchewan was 12 7 per 1 000 which is twelve times that among the general population and eight times that found among 3 376 normal students, mostly females, and approximately of the same age group as the nurses At the Cheshire Joint Sanatorium, where all new members of the staff are Mantoux tested and radiographed one out of fifty four nurses who were Mantoux positive developed tuberculosis in six months Out of eleven Mantoux negative nurses two became tuberculous whereas out of forty Mantoux positive and three Mantoux negative female domestics none developed the disease Likewise of a small outdoor staff of six males, five of whom were Mantoux positive none has developed tuberculosis and the other male is still Mantoux negative nineteen months later

What are the possible causes of a breakdown with tuberculosis among medical students and nurses? First, they run the ordinary risks of disease common to mankind secondly they are in a very true sense obviously contacts of known or unknown cases of tuberculosis, and thirdly the patients in most hospitals have not been taught what to do with their sputum Nor have the doctors and nurses been made to realize that they are contacts and their education in this matter has been sadly lacking—for example the white coat of the house surgeon should never be worn anywhere except on his rounds That medical men should indulge in taking a white coat in which they have examined patients rubbed along beds etc into a residency is anything but hygienic The white coat is rightly considered a badge of some importance but worn in the residency it becomes the uniform of the ignorant and though accepted as good form is nevertheless an abomination

What, then must be done? It appears to me that two things are essential first to fight against the breakdown from tuberculosis and secondly to deal with those who unfortunately suffer the breakdown

Medical Residents

As to the medical residents there is little they need do to protect themselves beyond realizing that a ward is ever a dangerous place that their white coats should be left in the ward annexe and that they themselves should take proper precautions and live a hygienic life At the commencement of their career they should be Mantoux tested, radiographed and overhauled Further examination should be repeated when necessary

Conditions of Nursing Service

It may be said that any discussion about the dangers to which nurses are exposed is likely to increase the already grave shortage However all hospitals have a duty to their employees and particularly to their nurses and I think the position of nurses might be reviewed in the light of advances in the care of the personnel of modern industry, where every effort is made to save fatigue where hours are shortened and where methods for the proper use of leisure are taught Nothing that I have said or that anyone has published should turn a single woman away from the nursing profession any more than it should turn anyone away from the medical profession

The first question concerns the conditions of the nursing service Are these by any modern standards what they ought to be? Is it not common sense that girls are not volunteering for the nursing profession because of the conditions under which they have to labour? In the investigation of the Joint Tuberculosis Council all sorts of answers were given as to the number of hours worked by a nurse It should not be forgotten that the nurse to-day has to do her ordinary ward work and in addition prepare for examinations The reports of the *Lancet* Commission deserve the most serious attention from the hospital world The Commission's recommendation of a fifty one hour week for nurses is on the harsh side Why should a nurse work fifty one hours a week in addition to study?

To say that the *Lancet* Commission has done harm to the nursing profession is to misstate the facts To say that it is impossible to shorten the hours of nurses is again wilfully to refuse to face facts It is for the hospitals to put their house in order When women understand that the working hours of nurses are forty or forty four per week and there is a reasonable opportunity given to them for study, that though the pay in the early years is rightly not much the housing conditions and the feeding are good and that on becoming fully trained there will be ample salary and absolute freedom for the trained staff when not on duty—then there will be a return of women to the nursing profession The modern trained nurse ought to be given the same freedom as a business girl all that the hospital is entitled to ask of her is that she shall be on duty to time be fit for her duty and do her duty and when that duty is over she should be given the opportunity to conduct herself as any business woman would In certain hospitals owing to lack of room sisters and staff nurses have had to live out and there has been no trouble At the Cheshire Joint Sanatorium for over four years the trained staff have run their own residential club and it has been a glorious success Living in for trained staff ought to be abolished

As to off duty periods these are not matters to be arranged from day to day or week to week All members of the nursing staff should know their off-duty period for weeks ahead This is a simple matter of organization and only grave emergency should be a justification for altering it

Nursing Uniform

Fever hospitals have for long shown the correct use of a nursing uniform Overalls are left behind in a changing room before the nurse attends for meals or goes off duty A simple uniform can be provided for the nurse to come and go between the ward and the nurses' home and in the ward there should be facilities for changing into an overall and for rechanging and scrubbing up before leaving One cannot understand how it is that the nurse's apron infected at the bedside is permitted at hospital tables and in recreation rooms

Personal Hygiene

This is one of the first things that a nurse should be taught, and it is well that a simple leaflet should be given her before taking up duties at the hospital The following is in use at the Cheshire Joint Sanatorium

IF YOU ADOPT STRICT PRECAUTIONS THE DANGER OF CONTRACTING ANY INFECTIOUS DISEASE IS REMOTE THIS IS PARTICULARLY TRUE OF PULMONARY TUBERCULOSIS

1 Sanatorium routine—ample air food rest and cleanliness—is not only best for treatment but also for prevention

Abundance of air and daylight in sitting rooms and particularly in bedrooms Abundance of food at regular meal times Abundance of bed—at least eight hours per night General cleanliness of the body and sufficient exercise

Suggestions

If you feel a little tired, rest when off duty, and if your tiredness persists report sick

If you fear that you have any symptoms of tuberculosis report at once Examination will ease your mind

Wash your hands thoroughly after handling infectious material and always before leaving the wards

Get out of uniform as soon as you can

2 *Patients*—Be relentless in enforcing the standing order for handkerchief and sputum disposal There is danger in the unseen spray resulting from coughing, loud talking and laughter Therefore insist upon the patient covering the mouth when coughing, and discourage loud talking and laughter

This leaflet should be amplified by personal instruction, I quote from the report of the Joint Tuberculosis Council

Particular emphasis should be laid upon the importance of thorough hand washing after attending the patient, also before meals and on going off duty ample facilities should be provided for this The risks of spray infection should be specially emphasized Every nurse in dealing with tuberculous patients should feel she will be supported in demanding their scrupulous attention to regulations as regards the use of sputum cups and personal habits

Age of Entry

Young women are at an age of greater susceptibility to tuberculosis, and it is probably wise, though not essential, that the age limit should be 18 years, for, with due precautions and proper conditions, I think the chance of contracting the disease is negligible Some urge that the age for entering the nursing profession ought to be raised to 21 I doubt the wisdom of this, for with the reduction in tuberculosis, tuberculization is becoming less and less, and it is quite possible that at 21 your prospective nurse will still be a negative reactor

The Negative Reactor

Should these girls be rejected if they are Mantoux-negative? On the other hand, should they be refused because they are Mantoux-positive? So far as medical students are concerned it is futile to talk of rejecting the medical student because he is a Mantoux-negative It is equally futile to talk of rejecting a nurse on such grounds, for in the future we shall probably find very many more negative reactors, and when protected properly the nurse, particularly in a sanatorium, will be infected with tuberculosis with difficulty, but there is no gainsaying that the negative reactor has in the past contracted the disease much more often than the positive reactor Thus there is all the more reason for keeping a sharp look-out The negative reactor should be examined radiologically every three months, should be weighed monthly, and should be placed under the special care of a senior member of the staff, to whom she should report her every ailment or symptom The results of the use of B C G by Heimbeck and Wallgren are most encouraging, but I doubt if it is necessary to introduce a general inoculation at this stage My own feeling is that a specially watchful eye, coupled with proper education of the nurse and patient, will probably prove sufficient

The Positive Reactor

The positive reactor must submit to a complete physical examination and a radiograph of the chest, be encouraged to report sick on the slightest provocation, and undergo a complete re-examination at least every year In a word, therefore, my suggestion is that women before being accepted as nurses should be Mantoux-tested, thoroughly examined, and *x*-rayed The radiograph should be repeated every three months with the negative reactors and whenever they are sick, and at least annually with the positive reactors Infectious technique must be taught and be insisted upon early in the training of the nurse, and her hours of work must be well regulated, her housing conditions put in order, and insistence made upon rest and ample sleep

For all patients admitted to a hospital *x*-ray films of the chest and sputum examinations should be a routine Young doctors entering on their course should be also subjected to a similar examination as the nurses, as well as all persons employed within the gates of an institution, though apparently the risk is negligible

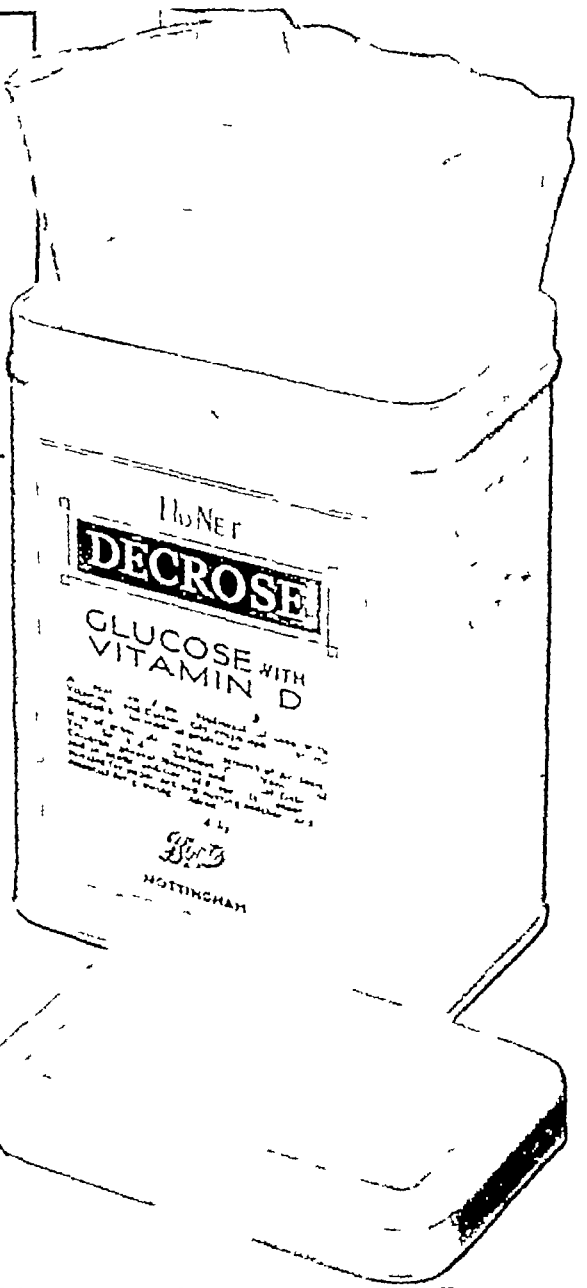
The Question of Superannuation

What of those who break down with tuberculosis, whether they be medical men nurses, or porters? In my opinion they should be regarded as suffering from an industrial disease and entitled to full treatment and full consideration thereafter

The report of the British Medical Association on the questions raised by the College of Nursing seems unsatisfactory, for I think it is not true that "local authorities are discharging their responsibilities in this matter to the utmost" How can it be said that local authorities are doing their utmost when those who break down with tuberculosis are, when later they become fit, rejected because of superannuation? From the point of view of superannuation authorities, to get tuberculosis is far more serious to a nurse or a doctor than to be inflicted with syphilis The mere hint of tuberculosis, irrespective of its extent or even its absolute cure, will banish them and hinder them for all time because of the bogy of superannuation

It has been pointed out that a nurse breaking down with tuberculosis usually does so at an early stage, and we know to day that early tuberculosis is to all intents and purposes curable, yet, once labelled, she is rejected by most local authorities because of superannuation The majority of medical superintendents of experience are in favour of employing tuberculous staff According to Burhoe of the After-Care Section of the National Tuberculosis Association, in the United States 3,520 ex-patients were employed in different types of work—physicians, nurses, dentists, etc According to the experience in that country the tuberculous individual, if guided in his choice of work under expert medical opinion, rarely fails to make good

Over half a million pounds per annum is being spent on wages to the staffs of sanatoria in England, and if a quarter of that amount were paid to ex-patients it would exceed enormously the amount paid in wages to workmen in the various employment schemes and settlements in the country



The time is ripe for local authorities to realize that many openings could be found for the tuberculous ex-patient on the staff of a sanatorium This would be a good thing not only for the ex-patient but also for the community The mere fact of having tuberculosis is no ground for employment the fact of having tuberculosis, with general fitness for work and progress towards arrest,

is also no ground for refusing employment in a sanatorium Since no one is entitled to superannuation benefit until the lapse of ten years the tuberculous staff might be accepted under such schemes without grave risk of bankrupting them as a tuberculous man who has survived ten years has an expectation of life not widely different from the normal population (Dr Trayer)

VINYL ETHER AS AN ANAESTHETIC AGENT*

BY

VICTOR GOLDMAN, L R C P, M R C S, D A

Although I have had some experience in the use of vinyl ether during the past two years I cannot claim to be in any way responsible for the great amount of experimental work that has placed this agent upon a scientific basis as an anaesthetic

This is I believe the first occasion upon which vinyl ether has been the sole subject of a discussion at an anaesthetics meeting in Great Britain and Ireland and I should like to open with a short account of the work which led to its use as an anaesthetic and to give you some of its chemical and physiological properties

History

Leake and Chen in 1930 demonstrated that vinyl ether possessed anaesthetic properties and in 1931 a purer and more stable product was prepared in the research laboratories of Merck and Co by Ruigh and Major and was used as an anaesthetic on dogs by Knoefel Guedel and Leake These investigators found that dogs were more easily anaesthetized by vinyl ether than by chloroform They also found that the period of recovery was rapid and free from vomiting moreover they did not notice any significant pathological effect on the various organs

The first experiments on human beings were conducted in 1933 by Gelfan and Bell who after trying vinyl ether upon themselves considered it worthy of clinical study The first extensive account of vinyl ether anaesthesia in man was published in 1934 when Goldschmidt and his colleagues reported having used it in operations in 461 mixed cases In all these cases vinyl ether appeared to have no undesirable effect on respiration the circulation the liver or the kidneys

Since then a number of anaesthetists have recorded their experiences with this agent, and the early claims for its safety seem to be well founded Its especial advantages in certain well-defined indications are now being recognized Wesley Bourne is particularly enthusiastic for the use of vinyl ether as the anaesthetic of choice in obstetric cases The first report of its use in England occurred in 1935 when Sir Francis Shipway recorded a series of 314 cases Besides these there are many reports which uphold the claim that it is of great benefit in short anaesthesias for its rapidity of action and for its use as an adjuvant to gas and oxygen anaesthesia

I may here quote from a report by Beach of Philadelphia on a series of 2 630 cases

> In endeavouring to place vinyl ether in the notch in which it seems most suitable our experience leaves us to suggest that it is most suitable in
>
> 1 Minor surgery in short cases
>
> 2 Major surgery only as a supplementary agent to the gases such as nitrous oxide and ethylene where increased relaxation is required
>
> 3 As an induction agent especially in children in an ethyl ether follow on
>
> 4 Obstetrical analgesia and short anaesthesias
>
> 5 In dental surgery
>
> 6 For short simple cases in the home or office of the ambulatory type and in cases where a gas machine is not available

It is interesting to note that Beach administers vinyl ether by the open method when using it alone but on the other hand Wesley Bourne its most enthusiastic supporter invariably uses a closed system with carbon dioxide absorption For major operations this appears to be the method of choice and I feel sure you will agree that this is so when we discuss its administration

Chemistry of Vinyl Ether

Vinyl ether is a very volatile clear colourless liquid It possesses a characteristic odour said by some to resemble garlic while others compare it to acetylene It has a specific gravity of 0 77 and a boiling point of 28 31 C (83 F) Its chemical formula is $\frac{CH_2CH}{CH_2CH}>O$ from which it is seen that vinyl ether is really a divinyl oxide whereas ethyl ether has the formula $\frac{C_2H_5}{C_2H_5}>O$ and is thus a diethyl oxide

Vinyl ether undergoes certain oxidation changes when exposed to light or air for any length of time and for this reason 3 5 per cent absolute alcohol is added and 0 01 per cent of a non volatile oxidation inhibitor If vinyl ether is kept for more than twenty four hours after the container has been opened it rapidly loses its potency and thus greater quantities are required to effect anaesthesia No toxic effect has however been noticed after using stale vinyl ether

It is highly inflammable and the same precautions are essential in its use as would be required for ethyl ether The following table gives the limits of inflammability of both vinyl ether and ethyl ether (Guedel 1937)

Vinyl ether and air	1 70 27 00
Ethyl ether and air	1 85–36 00
Vinyl ether and oxygen	1 55–85 00
Ethyl ether and oxygen	2 10–82 00

From this it is seen that in anaesthetic proportions vinyl ether combined with air or oxygen produces a highly explosive mixture

* Read in opening a discussion in the Section of Pharmacology and Therapeutics, including Anaesthetics, at the Annual Meeting of the British Medical Association Belfast 1937

"ALOCOL"

Colloidal Hydroxide of Aluminum

Effective in Nervous Dyspepsia

WHATEVER be the fundamental cause of nervous dyspepsia, it is acknowledged that alleviation of the gastric symptoms is an important part of effective treatment

Nervous dyspepsia connotes hypersecretion. This causes flatulence sour stomach discomfort and perhaps pain Alocol provides the ideal gastric sedative since its action is prompt and lasting and entirely free from harmful effects

Alocol' acts by adsorbing excess of free hydrochloric acid in the stomach, forming a colloidal jelly which passes through into the intestines and is finally evacuated Alocol therefore actually removes from the system the causative radicle (Cl) instead of merely temporarily neutralizing it. Alocol' does not interfere with normal digestion nor does it determine any unpleasant secondary reactions It is issued in tablet and powder form

Indian Sarasvati playing the Vina (12th Century)

Complete chemical history of Alocol with convincing clinical reports and supply for trial sent free to physicians on request

Works KING S LANGLEY HERTFORDSHIRE.

M-83

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non-narcotic analgesics available Too often however its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available.

"Alasil provides the beneficial therapeutic effects of pure acetyl-salicylic acid in such a form that it is acceptable even by disordered digestions This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with "Alocol a potent gastric sedative and antacid

Since Alasil is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter Alasil is therefore an analgesic antipyretic and anti rheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated

Pharmacology

Vinyl ether produces anaesthesia with great rapidity, surgical relaxation is excellent, and is similar to that obtained with ethyl ether The relative anaesthetic potency compared with ethyl ether was 4 to 1 when used on dogs and 7 to 1 when used on man Compared with chloroform the relative potency determined on dogs was 1 3 to 1 (*Goldschmidt et al.*, 1934)

Vinyl ether does not irritate the upper air passages, but it does cause an increased flow of saliva, and for major operations a pre operative dose of atropine is advisable It can be mixed with ethyl ether in any proportion, and the resultant mixture will vaporize in approximately even percentages An experiment has been conducted during which a stream of air was passed through a mixture of 27 per cent by weight of vinyl ether and 73 per cent by weight of ethyl ether The first 25 per cent of the material that came over analysed 31 5 per cent vinyl ether and the rest ethyl ether The last 10 per cent of the material that was carried over by the air contained 25 per cent vinyl ether

Moliter has anaesthetized a series of mice with various mixtures of vinyl ether and ethyl ether, and his results are given graphically in Fig 1 From this it is seen that

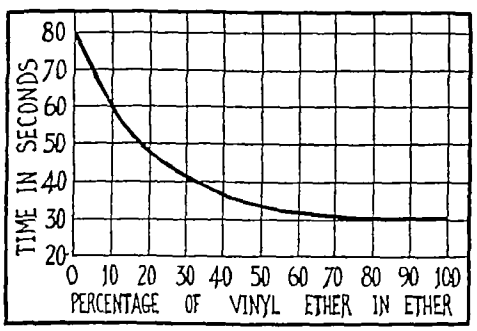

FIG 1 —The effect of vinyl ether upon the induction time of ethyl ether on mice

the lowering of the induction time is most marked after the addition of 10, 20, or 30 per cent vinyl ether Actually these animal experiments correspond fairly accurately with the clinical findings of anaesthetists who have used mixtures of these two agents Wesley Bourne (1937) has recently advocated the use of a mixture of 25 per cent vinyl ether with 75 per cent ethyl ether by the open method where it is not possible to use a 'closed" method with carbon dioxide absorption for long cases, and for obstetric use in the patient's home

Physiology

Vinyl ether owes its anaesthetic effect to the fact that it is lipoid-soluble In the blood, anaesthesia is produced with a remarkably small concentration, in dogs this is 28 mg per 100 c cm, whereas with chloroform it is 37 5 mg per 100 c cm During ethyl ether anaesthesia, however, the concentration is as high as 116 mg per 100 c cm Overdose produces respiratory arrest, but respiration returns rapidly on withdrawing the anaesthetic and inflating the lungs with oxygen

Peoples and Phatak (1934) have studied the effect of ethyl ether, ethylene, and vinyl ether on the intestinal muscles of rabbits They found that whereas ethyl ether always caused an immediate and marked loss of tone and inhibition of movement of the gut muscle, and ethylene caused a slight and transitory loss of tone with an occasional increase in the amplitude of contraction, vinyl ether uniformly increased the tonicity of the intestine Thus we may expect its use to be followed by less post-operative distension than with either ethylene or ethyl ether This view is supported by the clinical experiences of many observers

The action of this anaesthetic agent upon the liver has been investigated with extreme thoroughness by several workers, and it has been proved without question that vinyl ether has little action upon liver function, even when administered to patients with toxaemia of pregnancy As this aspect of the subject is of such importance I shall go into some detail concerning the work that has been done

Bourne and Raginsky (1935) administered vinyl ether to normal dogs, to dogs with livers damaged by chloroform, and to partially starved dogs, and the liver function was estimated by means of the bromsulphalein test The conclusions they arrived at were as follows

1 Vinyl ether anaesthesia in normal dogs does not alter the liver function appreciably In those cases where cyanosis is a feature of the anaesthesia moderate liver damage occurs which is not due to the action of the drug but to the associated cyanosis

2 Vinyl ether anaesthesia does not enhance the liver function damage produced previously by the inhalation of chloroform, nor does it delay the period of recovery from this damage

3 The effect of vinyl ether anaesthesia upon the liver function in partially starved dogs is not appreciably different from that produced in normal animals

In addition to experiments upon animals Wesley Bourne has carried out the bromsulphalein test in four obstetrical cases in which vinyl ether was used and in two cases in which chloroform was administered The results of these investigations are given in Table I It will be seen that

TABLE I —*Effect on the Liver in Obstetrics in Primiparae*

Case No	Age	Anaesthesia		Dye Retention	
		Method	Duration	%	Hours after
1	17	V.E. closed	51 min.	10	18
2	25	V E open	58	10	23
3	24	V E. closed	60	10	24
*4	18	V E. closed	39	5	24
5	21	$CHCl_3$ closed	30	25	24
6	21	$CHCl_3$ closed	35	20	24

* Case No 4 was a toxaemia of pregnancy with albumin and casts in the urine, and B P 160/105

the impairment of liver function was very much less marked after vinyl ether than after chloroform, and that the toxic case suffered little harm from the inhalation of vinyl ether

Moliter has approached the problem of the effect of anaesthetics on the liver in a novel but direct manner Cannulae are inserted into the bile duct and the duodenum of a rabbit The bile is then collected, measured, and weighed, and reinjected into the duodenum Before being collected the bile passes through a drop-recorder, so that the slightest change in the amount of bile secretion can be noted When chloroform is administered there is an immediate decrease in bile secretion, which continues after the anaesthetic has been withdrawn With ethyl ether there is a very slight initial decrease and a subsequent increase in the flow of bile When vinyl ether is admin-

A Light, Nutritious Diet

As an easily prepared easily assimilated, nourishing food 'Allenburys' Diet has marked advantages over milk and the usual milk dishes in sickness convalescence, old age, and other conditions

Prepared from pure, fresh, full cream milk and whole wheat both partly digested during manufacture it contains the chief food constituents in well balanced proportions and is much more digestible than milk itself

Added vitamin D (calciferol) in the form of irradiated ergosterol is present and by promoting the formation of sound bones and teeth makes the Diet specially suitable for children normal or passed the stage of infant feeding

In tins at 2/1, 4/- and 7/6

Clinical trial sample and literature sent free on application

Allen & Hanburys Ltd.,

London, E.2

istered there is no change in the flow of bile even though the anaesthetic last for two hours When a mixture of 95 per cent nitrous oxide with 5 per cent oxygen is applied there is an almost complete cessation in the flow of bile, which is apparent immediately If a change is now made to a mixture of 80 per cent nitrous oxide and 20 per cent oxygen with sufficient vinyl ether to continue deep anaesthesia the bile commences to flow again and resumes its normal rate within five minutes All this tends to support the view that anoxaemia is the primary factor in the production of liver necrosis

Determinations of the coagulation time of the blood following vinyl ether anaesthesia show that the administration of this drug produces little if any change as may be seen in Table II (Bourne *et al* 1937)

TABLE II—*Effect of Vinyl Ether Anaesthesia on Coagulation Time of Blood*

The blood sugar is raised at the beginning of a vinyl ether administration but it falls fairly rapidly in contrast ethyl ether produces a considerable and sustained rise in

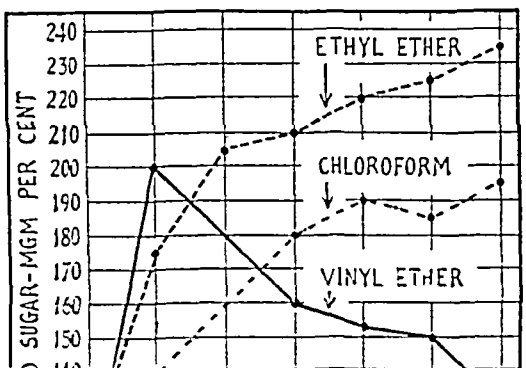

FIG 2—Blood sugar response of male rats to anaesthetics.

the blood sugar This is seen in Fig 2 which demonstrates the effect of various anaesthetic agents upon the blood sugar of rats (Emerson *et al* 1937)

Cardiac irregularities have not been noticed in any of my cases and there has been little if any fall in the blood pressure The chart of a typical case is seen in Fig 3 The patient was a boy aged 13 who was admitted to hospital for a tibial graft to the left radius on account of fracture The physical findings were normal He was given as premedication 1/100 grain of atropine at 1.30 p m The anaesthetic used was 22 c cm of vinyl ether by the closed method with absorption by Wilson soda lime Consciousness was regained at 3.20 p m

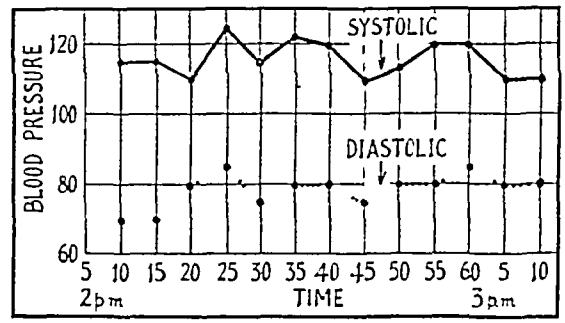

FIG 3

Methods of Administration

Vinyl ether may be given by the open or closed method, and as an adjuvant to gas and oxygen as follows

(*a*) *Open*—Vinyl ether Mixtures with ether

(*b*) *Closed*—To and fro for minor surgery absorber added for long cases

(*c*) As an adjuvant to gas and-oxygen In a Boyle or a McKesson machine diluted with ether with drip regulator, with Rowbotham's chloroform bottle

The administration of vinyl ether by the open method has not proved a success in my hands although Saghirian reports a series of 150 dental cases in which the method was used successfully I have found that the extreme volatility of vinyl ether makes it difficult to maintain an even plane of anaesthesia for prolonged cases and for short cases considerably more vinyl ether is used than by a closed method On the other hand a mixture of one part of vinyl ether to three parts of ethyl ether when used on an open mask gives excellent anaesthesia Induction is rapid and relaxation adequate in fact this mixture has all the advantages of a chloroform-ether mixture without its dangers With regard to the closed method of administration for dental and other minor operations I do not propose to go into detail here it has already been described (Goldman 1936) Since its introduction in March 1936 the method has been in daily use at the Eastman Dental Clinic and up to April 30 1937 a total of 1 342 children had been anaesthetized with vinyl ether Only five of these cases were sick after the administration and not a single child has had to be detained for any post anaesthetic complication It is the opinion of the nurses at the clinic that the children who have had vinyl ether recover as uneventfully as after a straight gas and many are fit to leave the clinic sooner than those who have had gas Ramage has reported the use of this method in a school dental clinic and seems to be equally satisfied with it

For major operations with vinyl ether anaesthesia the closed system combining carbon dioxide absorption is the method of choice We prefer the to-and-fro system of Waters (1931) in which the soda lime canister is fitted between the face piece and the rebreathing bag with a small tube on the face piece mount for the anaesthetic gas supply A small "bubble through" bottle holding 25 c cm. is attached to the oxygen supply coming from a

gas and oxygen machine fitted with a finely calibrated oxygen flow meter During induction oxygen is bubbled through at the rate of half a litre a minute, and in three to four minutes the third stage of anaesthesia will have been reached The oxygen flow is now reduced to between 200 and 300 c cm a minute, according to the patient's metabolic rate As soon as the required depth of anaesthesia has been attained the by-pass on the vinyl ether bottle is opened, so that only pure oxygen is now given to the patient Only at occasional intervals when anaesthesia becomes lighter is it necessary to add more vinyl ether By this method we average about 20 to 30 c cm of vinyl ether an hour for an abdominal operation, and, in addition to the economy of the method, the patient derives all the benefits of a closed system of anaesthesia There is no reason why induction should not be carried out with gas and oxygen or evipan, and there is no contra-indication to the use of a basal anaesthetic with vinyl ether

As an adjuvant to gas-and-oxygen, vinyl ether has many uses, such as a difficult nasal gas case, or to obtain just that extra amount of relaxation that is so helpful in an abdominal operation It can also enable a gas and-oxygen anaesthetic to be given to a heart case without reducing the oxygen to a dangerous level The simplest method of adding vinyl ether to a gas and-oxygen anaesthetic is to put some of the 1 3 vinyl ether in ether mixture in the ether bottle provided on most gas machines

A more accurate method is to fit a drip device between the rebreathing bag and the mask Such a device has been made for me, and has recently been described (Goldman, 1937) Dr Rowbotham has devised an excellent vaporizer which serves the same purpose, although it was introduced originally as a means of giving chloroform with a McKesson machine, and this is the method in use in the obstetric unit of the Royal Free Hospital

The following tabular statement, which gives my personal experience with vinyl ether, shows that although the number of major operations is not large these cover a wide field of surgery

Methods of Administration	
Vinyl ether alone major and minor	1,150
Vinyl ether–ether mixtures, major	4
Gas and-oxygen plus vinyl ether major	37
Total to May 30, 1937	1,191
Operations Performed	
Dental cases	1,093
Minor operations, etc	24
Major abdominals	27
Major orthopaedic	17
Major ear, nose, and throat	13
Major gynaecological	5
Thyroidectomies	2
Amputation of breast	2
Other major operations	8
Total	1,191

The longest case so far was that of a woman aged 54 who had a partial gastrectomy performed She had, as premedication, a hypodermic injection of 1/6 grain of morphine and 1/150 grain of hyoscine Vinyl ether was given in a closed system by means of a Waters canister, after induction an endotracheal tube was passed by means of a laryngoscope, and the whole operation took 105 minutes, during which time 45 c cm of vinyl ether were used The patient made an excellent recovery and she did not vomit

I have had no death due to the anaesthetic, and there have been few complications, the only one of note was a gastro enterostomy, in which a parotitis developed on the second day This may have been due to increased salivation caused by vinyl ether However, this cleared up in a few days The other patients all had uneventful recoveries, only a few vomited after the anaesthetic

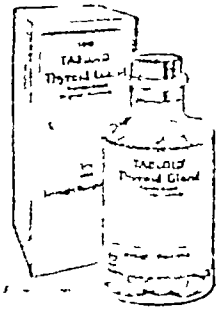
Summary

Vinyl ether is a potent anaesthetic for major and minor surgery

It has been used in a large variety of cases, and it is suggested that its sphere of usefulness is a wide one.

Administration by means of a closed inhaler has advantages over the open method

A series of 1,191 cases is reported, without a death or serious complication



In conclusion I should like to thank the surgeons and anaesthetists on the honorary staff of the Royal Free Hospital and Eastman Dental Clinic for their help and encouragement, and also Mr H Tally of Messrs A. Charles King for his assistance in the manufacture of the apparatus necessary

H Brockmann (*Klin Wschr* October 2, 1937) points out that it has long been known that substances containing vitamin D vary considerably in their effect in the treatment of rickets —for example, cod liver oil is more effective than irradiated ergosterol These variations have been explained as follows (1) irradiated ergosterol contains, besides the antirachitic factor, one which raises the phosphorus content of the blood (2) human rickets is a combined D- and A avitaminosis, and the administration of vitamin D alone (ergosterol) fails to relieve all symptoms as does cod liver oil, which contains D and A Brockmann believes, however, that the real reason is that the vitamin D of ergosterol differs in characteristics from that of cod-liver oil The former is D_2 the latter D_3 He was able to obtain vitamin D_3 in pure form and to prove that it was far more effective than D_2 in the treatment of rickets. Twenty one infants were examined before treatment and a record made of the clinical features the phosphorus content of the serum, and the x ray findings Two daily doses of 0 07 mg. of D_3 (which is one half to two-thirds of the threshold dose of D_2) were administered, the infants being treated in hospital. In every case a complete cure was obtained after a two to three weeks course No butter was included in the diet, and ultra-violet ray therapy was withheld The errors occurring during ambulant treatment by other investigators were avoided

SUPREME QUALITY IS BURROUGHS WELLCOME QUALITY

ANAESTHESIA IN MINOR SURGERY*

BY

J H T CHALLIS, M R C S

Assistant Anaesthetist London Hospital

Under this heading it would be possible to discuss every type of anaesthesia past and present Obviously this would serve no useful purpose so it is proposed to limit the remarks to a definition of the ideal and then give the advantages and disadvantages of a few of those anaesthetics in constant use for this type of surgery

The definition is covered by the following six requirements (1) That the anaesthetic is safe (2) That the patient should not be hindered from continuing his work up to the time of the anaesthesia (3) That the necessary depth of anaesthesia be induced for the successful performance of the particular operation (4) That the patient should regain consciousness quickly and be capable of resuming his occupation in the least possible time (5) That the minimum damage is done to the tissues of the body (6) That the type of anaesthesia shall not be unpleasant to the patient

Choice of Anaesthetic

It is obvious that all these requirements cannot be fulfilled Certainly the nearest approach to the ideal is local anaesthesia which has a very wide field of usefulness but luckily for the anaesthetist, even this type of anaesthetic is not possible in every case owing perhaps to the patient's nervousness or to infection of the operation site

The second anaesthetic of choice would be evipan or pentothal sodium but here again we fall far short of the ideal as this type of anaesthetic is difficult of use if not dangerous in small children who probably form the largest group requiring minor surgery such as removal of tonsils and adenoids circumcisions and dental extractions Again evipan and pentothal sodium are contra-indicated in toxic patients in the old and feeble in liver diseases and in hyper- and hypo tension In suitable cases such as good anaesthetic risks it is advisable to prepare patients before the administration of these two drugs and in the case of evipan premedication in the form of 1/3 grain of omnopon and 1/150 grain of scopolamine should sometimes be given and allowance be made of anything up to eight hours for recovery after operation

Nitrous Oxide and Oxygen

We have in this combination perhaps the most useful anaesthetic working as we do in this country under social conditions that do not permit of patients lying about in dental surgeries and hospital out patient departments for hours recovering from the after effects of anaesthesia

Now the essential pre operative treatment of a patient about to receive nitrous oxide and oxygen is starvation for three hours before administration It is a real advantage but by no means essential to give some sedative drugs such as omnopon 1/3 grain and scopolamine 1/150 grain one hour prior to induction Should the surgical procedure permit immediate return to work and the surgeon be willing and able to operate on a patient who may move slightly and is not relaxed there is no indication for any premedication

During the past few weeks patients have been given an alkaline powder—bisedol two teaspoonfuls in a little water—immediately before the administration of nasal gas for dental extractions It appears from a very limited experience that these patients make a better and quicker recovery than those who have not received this alkaline treatment In these cases nitrous oxide and air not oxygen were given as it was felt that oxygen administered from a cylinder tends to cause giddiness and an inclination to vomiting much greater than with nitrous oxide and air The method just described is adopted only for short dental extractions and while I fully realize that it is more difficult to maintain a good colour and steady anaesthesia with this technique the after results seem to justify it

Vinyl ether which certainly has a definite place in anaesthetics for minor surgery is dealt with by my colleague in detail in another paper (see p 1265)

Ethyl Chloride

When administered either in a closed bag or on an open mask this drug has many points approaching those of the ideal anaesthetic It is not unpleasant and if given in the sitting position most children can be put to sleep without fright struggling or those unpleasant scenes so often associated with the induction of anaesthesia without premedication The absence of depth and length of anaesthesia are perhaps its greatest handicaps and although methods have been devised for continuous ethyl chloride anaesthesia it is felt that these are not as safe as the administration of gas oxygen and a small quantity of ether should the necessity arise Therefore the use of ethyl chloride is usually limited to the induction of anaesthesia or to those surgical procedures requiring it the most one to two minutes for their performance

Ether

This drug fulfils only two of the requirements of this type of anaesthesia—first it is certainly the safest and secondly any stage or depth of anaesthesia required can be reached and maintained for as long as necessary Owing to its unpleasant induction post operative vomiting slow elimination and damage to tissues generally it is only used in conjunction with nitrous oxide and oxygen to assist in maintaining a quiet and even anaesthesia and then in quantities just large enough to obtain relaxation should this be necessary There is at least one surgical condition in which the induction and maintenance of anaesthesia should be performed by ether and ether alone—namely a second surgical intervention in a patient who has become exsanguinated and is still bleeding after the removal of tonsils It is felt that this second surgical procedure which is realized by all to be a most serious undertaking would be greatly endangered should the anaesthesia cause any cyanosis or further fall in blood pressure as is certain to happen with the administration of nitrous oxide chloroform or any of the barbiturates

Chloroform

This has its definite uses and if it were not for the fact that it is the cause of the majority of anaesthetic deaths it would still hold a primary place in the list of anaesthetics administered In spite of this great disadvantage it is certainly the anaesthetic of choice in a few minor surgical procedures such as the production of analgesia or perhaps the first stage of anaesthesia when opening a

ANAHÆMIN B.D.H.

In the treatment of pernicious anæmia

Treatment of pernicious anæmia patients with Anahæmin B D H possesses a two-fold advantage it is effective and, at the same time, inexpensive Both these advantages accrue from the fact that Anahæmin is a highly potent substance, thus dosage is low and the intervals between injections are long

A remarkable reticulocyte response is evident within a few hours of the first injection, there is also an appreciable rise in the red blood count, which reaches normal in five to six weeks in the majority of cases Clinical reports to this effect are available from all parts of the world, one such report is cited below —

' I have had a striking case of success with Anahæmin B D H I attended a woman showing every symptom of genuine pernicious anæmia Red blood count 536,000, and extreme debility It was impossible to provoke the slightest sign of blood in the hand or leg Initial injection 3 c c followed by 1 c c two days later, and 1 c c five days later In 10 days the woman was moving about the house freely and eating well, hands and legs a natural flesh colour '

Anahæmin B D H is available in 1 c c and 2 c c ampoules, also in rubber-capped vials of 30 c c

quinsy, also for those minor surgical operations associated with midwifery, when the more elaborate apparatus required for the administration of nitrous oxide and oxygen or cyclopropane is not available

Cyclopropane (C_3H_6)

This comparatively new anaesthetic has a definite place in anaesthesia for minor surgery, as premedication can be dispensed with entirely, although it is an advantage to administer small doses such as 1/100 grain of atropine and 1/6 grain of morphine It is not unpleasant from the patient's point of view, and any stage of anaesthesia required can be quickly and easily produced, although the profound relaxation of deep ether or spinal anaesthesia cannot be obtained Complete and absolute recovery with cyclopropane is rapid, post-operative complications are rare, with the exception of vomiting, which, strange to relate, is usually unassociated with nausea and does not distress the patient to any extent

Cyclopropane cannot be classified as an entirely safe anaesthetic, although, unlike chloroform, some warning of impending disaster is certainly given by failure of respiration, rapidly increasing pulse rate, or a pulse rate below 50, but, owing to its quick elimination, it is easy, by washing out or diluting the anaesthetic with oxygen, to get the patient to a lighter and safer plane of anaesthesia The high cost of this gas makes it essential that it be administered always by a close-circuit system, of which there is no standard pattern in Britain at the moment, but many types of apparatus are being experimented with, and it is possible that in the near future an apparatus which is easily portable, efficient, and moderately inexpensive will be on the market

Conclusion

From these remarks on the relative merits of the various anaesthetic agents at our disposal for administration in minor surgical procedures it is obvious that no one drug is much in advance of the others in efficiency and safety, and that choice of the anaesthetic must depend on the surgical operation to be performed and the social and economic conditions of the patient In conclusion it might well be stressed that so-called minor surgical proceedings require as much skill and ability on the part of the anaesthetist as major operations where the patient has been properly prepared, examined, and premedicated Too often does one hear a surgeon tell a patient that a mere whiff of anaesthetic is all that is necessary before, say, a manipulation which we all know requires full and profound surgical anaesthesia

---

A Jores (*Med Welt* October 2 1937) discusses the relations between the hypophysis and renal affections as met with in pregnancy, in eclampsia in Cushing's syndrome and in nephritis There seems to be a connexion between the basophil cells of the hypophysis and increased blood pressure It has been proved experimentally on rabbits that the administration of large doses of extract of the posterior lobe of the pituitary gives rise to patches of necrosis in the liver and to changes in the kidneys similar to those observed in eclampsia On the other hand in about one third of the cases of Cushing's syndrome the kidneys showed histological evidence of sclerosis at the post mortem examination Similarly there seems to be a definite connexion between acute nephritis and the system composed of the hypophysis and the middle brain The author however warns against exaggeration of the importance of the hypophysis in renal affections

VISCERAL PAIN*

BY

JOHN MORLEY, Ch M, F R C S

Professor of Surgery Manchester University Honorary Surgeon Manchester Royal Infirmary

The subject of visceral pain is a large one and some limitation of my subject is essential We can consider visceral pain first as Nature's danger-signal, and our most valuable aid to diagnosis This involves a determined attempt to unravel and understand its mechanism, for we may be sure that if we cherish any illusions as to that mechanism our diagnosis will go astray But there is an alternative and no less necessary point of view We may consider visceral pain not as a warning, grim at times, yet on the whole beneficent, but as a calamity from which our patients implore us to deliver them When the pain originates in a hopeless condition such as an inoperable carcinoma of the rectum or intractable angina pectoris, though the surgeon must still be familiar with the nervous pathway by which the pain is transmitted to the sensorium, he is less concerned with what he can learn from that pain than with what he can do to relieve it I propose, therefore, to limit my remarks to the mechanism of visceral pain from its diagnostic aspect, and to deal for the most part with pain originating in the gastro intestinal tract

The problem here is a peculiar one, differing, for instance, from that of pain in the genito urinary system, since the gastro-intestinal tract is quite insensitive to the stimuli—cutting, burning, etc—which cause pain when applied to the somatic nerves, and yet is supplied with afferent nerve fibres capable of causing direct visceral pain in response to an adequate stimulus We have quite discarded, I think, the theory of Lennander that there is no such thing as true visceral pain in the gastro intestinal tract, and also the theory of Mackenzie that all pain in gastro intestinal lesions is referred to the somatic nerves of the abdominal wall The one stimulus adequate to produce direct visceral pain in the gastro-intestinal tract appears to be tension on the afferent nerves in its muscular coats, and this tension is usually caused by spasmodic and exaggerated peristaltic contraction

The afferent nerves supplying the insensitive intraperitoneal viscera show no anatomical features that distinguish them from the somatic sensory nerves, but their physiological limitations are so striking that we are justified in regarding them as a separate system, to which we may perhaps give the name of viscero-sensory nerves It must not be forgotten that the mesentery and mesocolon are supplied by somatic sensory nerves to within a short distance of their attachment to the bowel, though the great omentum appears to be devoid of any sensory nerves subserving pain The sensitive mesentery is often involved in such lesions as strangulation and volvulus, and this causes a combination of visceral and somatic pain that is not easy to unravel

Characteristics of Pure Visceral Pain

We can study the features of visceral pain in the intestine in its purest form in strangulation of a small knuckle of the lower small intestine in a femoral hernia I insist that the knuckle must be a small one, because then the sensitive portion of the mesentery is not involved Another equally good lesion for our purpose is a stenosing

* Read in opening a discussion in the Section of Anatomy Physiology and Biochemistry at the Annual Meeting of the British Medical Association Belfast, 1937

BRITISH MEDICAL JOURNAL

SATURDAY DECEMBER 25 1937

HISTAMINE IN MODERN MEDICINE

Histamine was first prepared synthetically in 1907, and a few years later was found in ergot of rye by Barger and Dale It soon proved to be a substance possessing remarkable pharmacological, physiological, and pathological properties [1] Chemically histamine is B-iminazolethylamine, and is easily prepared from the closely related amino acid histidine by a number of procedures which cause the expulsion of a molecule of CO_2 The principal actions of histamine have been elucidated mainly by Dale and his co-workers [2] It stimulates smooth muscle widely, especially that of the bronchioles, the small and large intestine, and the uterus, it greatly increases the flow of tears and of gastric juice, but seems to have little or no direct action on the pancreas It causes a widespread and intense dilatation of the minute vessels and, in some species, of the arterioles also the dilated capillaries become more permeable and allow the escape into the tissue spaces of a considerable amount of plasma, with the result that there is a rise in the concentration of the blood and a decrease in its volume The profound fall of blood pressure which takes place is due mainly to the failure of the venous return and the diminution in the cardiac output Subsidiary factors, however, are the decrease in the peripheral resistance and in the blood volume Larger doses of the drug lead to a state of grave circulatory shock, which ends secondarily in failure of the vital medullary centres from lack of oxygen Histamine has been demonstrated in extracts of many tissues, especially of lung, human epidermis, liver, and smooth muscle These extracts lower the blood pressure in animals on intravenous injection and have at times been used clinically for this purpose Their depressor action, however, is only in part due to the presence of histamine and in part to a number of other depressor substances, such as derivatives of choline and adenosine and other unidentified bodies Histamine can also be extracted from normal blood and seems to be derived from the white cells, especially the eosinophil leucocytes [3] It may be recalled that an enzyme known as histaminase,[4] which is capable of destroying histamine, has been demonstrated in the lung and other organs, and may be concerned with the removal of any histamine which enters the circulating blood

There is convincing evidence that histamine may be liberated under normal conditions in the body and serve as a local regulator of the circulation It is claimed[5] that histamine is released in skeletal muscle during activity, and it is thought that its presence may help to increase the blood supply of the tissue in accordance with its needs Again, when the blood supply of a limb is obstructed for some time and the circulation is then released an intense flushing of the skin develops known as "reactive hyperaemia," which persists for some time —a reaction for which histamine may be responsible [6] The most striking evidence has been provided by Sir Thomas Lewis's work on the responses of the blood vessels of the human skin [7] If the skin is scratched, burnt, frozen, or injured in any other way the so-called "triple response" occurs This consists of a local capillary dilatation limited to the site of the injury, the formation of a wheal, which is due to a fluid rich in protein passing through the walls of the more permeable capillaries, and, lastly, the appearance of an irregular flare, which can be shown to result from a dilatation of arterioles produced by a local axon reflex A triple response identical in all respects with that just described is also obtained when histamine is inoculated into the human skin This resemblance is not fortuitous, and the characteristic vascular responses of injured skin are the outcome of the liberation of histamine in the epidermis from some unstable precursor The well-known changes wrought in the skin by strong sunlight have been accounted for in the same way When the local injury to the skin is severe, histamine may be absorbed into the blood stream and give rise to such systemic changes as a fall of systolic and diastolic pressure, flushing of the skin of the face, and an increased secretion of gastric juice, in addition to the local reaction All these findings can be readily correlated with the fact that considerable amounts of histamine can be easily extracted from epidermis, though little can be obtained from the deeper layers of the skin In sufferers from urticaria factitia quite light stroking of the skin may induce a marked flare

cancer of the transverse or pelvic colon causing a high grade of obstruction In both conditions the pain occurs in intermittent spasms lasting half a minute or so and repeated at regularly recurring intervals Where the obstruction is of some days standing, with each spasm of pain hypertrophied coils of bowel above the obstruction may be both felt and seen in abnormally vigorous peristalsis, demonstrating in a most convincing manner the mechanism by which the pain is caused

If, then, we interrogate and examine a patient suffering from such a visceral pain we find that it is felt as a central pain and not on the surface of the abdomen We also find that it is quite vaguely localized though in the case of the small intestine strangulation it is localized at or above the level of the umbilicus, whereas in cancer of the colon whether in the transverse or pelvic portion, the patient points to the hypogastrium as the seat of the pain Physical examination reveals a complete and remarkable absence of objective somatic manifestations We find no superficial hyperalgesia, no deep tenderness and no muscular rigidity and movement of the abdominal wall does not accentuate the pain, so that the patient often writhes about in a vain attempt to obtain relief

That is the picture of the purest and most certain visceral pain in the gastro intestinal tract that we know A similar picture is seen in the early hours of an attack of acute appendicitis with obstruction of the lumen of the appendix Here, too we find the same vaguely localized central pain and the same absence of any somatic manifestations such as tenderness and rigidity

On the other hand, where an abdominal pain is associated with reflex muscular rigidity and with deep tenderness on palpation, the strict localization of this rigidity and tenderness suggests a somatic origin for the reflexes We see this most convincingly in acute appendicitis where the site of the second pain in the right iliac fossa with its corresponding area of tenderness and rigidity varies from case to case with the position in which the appendix happens to be lying so that in almost every case before we operate we can predict where the inflamed appendix will be found

I have argued before that these clinical facts drive us to the inevitable conclusion that the nerves of the sensitive parietal peritoneum must receive the stimulus that gives rise to the pain and tenderness in the superficial parts of the abdominal wall and to the associated reflex muscular rigidity and I have described the process as peritoneo cutaneous radiation and a peritoneo-muscular reflex An appreciation of this peritoneo-cutaneous radiation is essential for any true understanding of abdominal pain and the mechanism is best illustrated by stimulation of the phrenic nerve terminals below the diaphragm When the under surface of the central portion of the diaphragm receives a painful stimulus immediate pain is felt in the region of the descending branches of the third and fourth cervical nerves supplying the skin of the supra acromial region The following experiment typical of many demonstrates both the extreme sensitivity of the afferent nerve fibres and the essential features of referred pain

A man 20 years of age was operated on for chronic appendicitis under spinal anaesthesia which extended to the fifth dorsal segment Pressure with a gloved finger was made on the under surface of the right dome of the diaphragm in its anterior central part The patient immediately complained of sharp pain over the front of the shoulder on the right clavicle The area in this area was lightly probed and was hyperalgesic Immediately the stimulation of the diaphragm was stopped the pain and hyperalgesia disappeared No pain was felt in the region of the diaphragm A hand was then introduced behind the bare area of the liver and the diaphragm pressed upon with a finger in its posterior part Pain was at once complained of over the suprascapular region and the skin in this area was also found to be hyperalgesic Again on ceasing to stimulate the diaphragm the pain disappeared, and with it the hyperalgesia though two or three minutes later the patient complained of a transient return of the pain and soreness lasting a minute or so

I have shown that infiltration with novocain of the area of skin supplied by the third fourth, and fifth cervical nerves either abolishes or greatly modifies the referred pain caused by stimulation of the diaphragm (Morley, 1931) The experiment has been indirectly criticized (Woollard, Roberts, and Carmichael 1932) but it has been several times repeated and the fact must be accepted as established The mechanism of this shoulder tip pain is a matter of extreme interest It is beyond question purely somatic since the third fourth and fifth cervical segments of the cord have no neural connexions with the abdominal viscera The theory that has commonly been held to explain it is that propounded by James Ross of Manchester (1888)—the theory of an irritable focus in the spinal cord I have long pointed out the objections to Ross's theory of the diffusion of pain through an irritable focus in the cord so far as the viscero sensory nerves from the gastro intestinal tract are concerned but have reluctantly held to it as a working hypothesis to explain this shoulder tip pain from phrenic stimulation My reluctance has been based on the complete absence of any real physiological evidence in support of such a mechanism—any crucial test of its existence

An Alternative to the 'Irritable Focus' Theory

Recent experimental work on action currents combined with division of the posterior nerve roots would seem to provide us with a simpler and more rational explanation of this peritoneo cutaneous radiation of pain Barron and Matthews (1934-5) have shown that some 40 per cent of the posterior root fibres of the spinal nerves can carry centrifugal impulses Of these a large proportion start in a peripheral sense organ and run to the cord There one collateral (or more) passes along or a short distance up or down the cord and leaves it again by a different rootlet from that containing the entrant fibre though it may be in the same or a different posterior root It then passes to the periphery often to a point far distant from the original sense organ Barron and Matthews found that of fibres entering the cord by the posterior roots more than half send collaterals out to the periphery via a posterior rootlet different from that by which they enter

They have found further that when a single afferent fibre in a posterior spinal rootlet is stimulated the impulse emerges through its efferent collateral or collaterals in other rootlets with no more delay than can be ascribed to conduction time This observation gives conclusive evidence that the efferent fibres referred to are collaterals of the posterior root ganglion cells and that no synapse is interposed in their course within the central nervous system Yet despite this absence of a synapse in which modification of impulses within the central nervous system can proceed there does appear to enter the conduction of impulses and [illegible]

It is [illegible] description of [illegible] fibres as purely afferent [illegible]

and wheal As the injection of histamine into the skin of these patients produces a normal local response it may be concluded that the condition is not one of unusual reactivity of the local vessels it seems probable that the precursor of histamine is present in the skin in an excessively unstable form so that even trivial injuries break it down

After severe burns the concentration of histamine in the blood may rise to three or four times its normal value in the course of a few days, and these changes are roughly paralleled by the gravity of the clinical state [8] The obvious deduction that the toxic action of burns may be partly the result of the liberation of histamine led to the tannic acid treatment The underlying idea was to precipitate the histamine at its site of formation and so prevent its absorption into the circulation but it is probable that tannic acid helps in other ways, as, for instance, by diminishing pain and decreasing local loss of heat and water It is natural that histamine should have been suspected as a causative factor in traumatic shock, but the evidence on this point is conflicting It is conceivable, though not yet proved that in certain types of injury histamine and other agents lowering blood pressure may be liberated from damaged tissues and contribute their quota to the clinical picture In other cases, however such factors as excessive anaesthesia haemorrhage anhydraemia, great loss of heat, infection, or painful afferent impulses may singly or in various combinations be the principal factors concerned The role of histamine in anaphylactic shock is clearer [9] It was early noted that the chief manifestations of histamine poisoning differed in different species but closely resembled those of anaphylactic shock in the particular species studied Thus in both conditions there is in the guinea pig intense bronchial constriction, in the dog constriction of the hepatic veins leading to engorgement of the liver and in the rabbit constriction of the pulmonary arterioles When the specific antigenic protein is injected into a sensitized animal histamine is formed in certain organs This has been demonstrated in the lungs of the guinea pig [10] in which animal it has also been found that the histamine is not synthesized but liberated from some closely related precursor The antigenic protein seems to react with a specific antibody present in different organs and consequently some toxic agent is liberated which results in cell damage One of the signs of such injury here as elsewhere is the release of histamine It may be supposed then that the phenomena of anaphylactic shock will be mainly those of widespread tissue damage combined with some of the characteristic effects of histamine, both on the organs where it is primarily formed and elsewhere as a result of absorption It has lately been shown that staphylococcal toxin and a number of snake venoms which damage tissues cause histamine to be liberated in the lungs [11] Histamine must therefore be considered as a possible noxious factor whenever there is damage to tissues

Histamine has been employed clinically to determine the circulation time [12] but reliable results can be more safely and satisfactorily obtained with other substances such as decholine [13] The main use of histamine in modern practice is, however as a test of gastric secretory function [14] Usually 0 75 mg of the drug is injected subcutaneously the gastric contents are completely aspirated at intervals of ten minutes from the twentieth to the fortieth minute and the specimens are examined for volume and total acidity The test is of special value in cases of suspected achylia The absence of free acid in the gruel meal may be due either to absence of secretion or to excessive neutralization In the latter case the histamine test will demonstrate the secretion of acid sometimes in large amounts Additional significance can be attached to the histamine test in view of the evidence that histamine may be identical with the hormone gastrin, which is normally responsible for the second or chemical phase of gastric secretion Histamine must be employed cautiously when the initial blood pressure is low in some cases it gives rise to headache, which may be severe and lasting The interesting researches of Pickering [15] suggest that this headache is the result of changes in the cerebral circulation which lead to stretching of the dura mater and consequent stimulation of the local sensory endings of the fifth nerve

ROCKEFELLER CONTINUED

The bare record of the activities of the Rockefeller Foundation during 1936 is more eloquent than any comment could possibly be The Foundation gave away about £2 250 000 It co-operated financially with 130 national and local governments universities and educational institutions made available to scholars engaged in advanced work over 200 grants in aid provided some 700 fellowships (200 of them in public health and seventy seven in medical sciences) for postgraduate training of

This recent discovery of efferent collateral fibres in continuity with the cells of the posterior root ganglia appears to me to give us a probable key to the mystery of peritoneo-cutaneous radiation of pain, without any violation of the law of forward conduction associated with the names of Bell and Magendie Is it not probable that, on stimulation of the phrenic nerve, efferent fibres in the posterior roots run down to the skin supplied by the third, fourth, and fifth cervical segments, and there liberate a chemical metabolite which stimulates the endings of adjacent pain fibres in the skin (see diagram)? The work of Sir Thomas

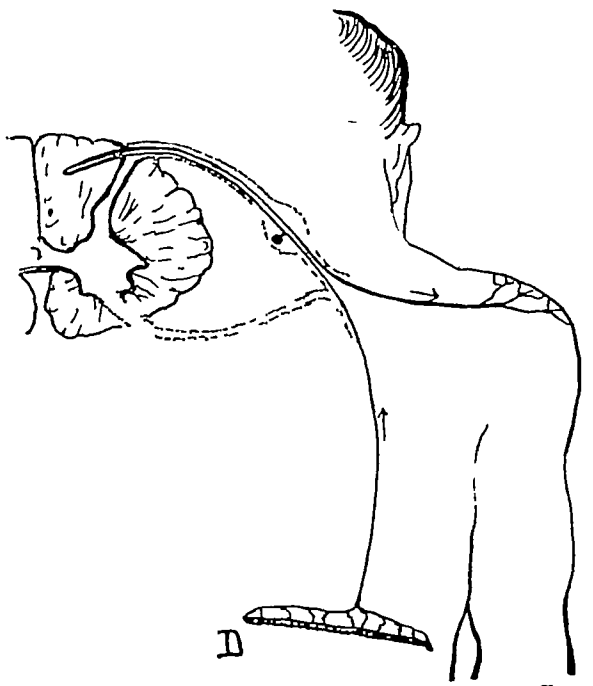

Diagram showing possible mechanism of referred pain on stimulation of phrenic afferent fibre in diaphragm (D) The sensory nerve from the skin of the shoulder is not depicted

Lewis has made us familiar with the conception of pain as due to the action of a chemical substance on the sensory nerve endings But it is plain that the nocifensor system of nerves postulated by Lewis (1937) cannot be held responsible, since the hyperalgesia produced in his experiments took many minutes to develop and persisted many hours, whereas shoulder-tip pain and its associated hyperalgesia develop instantly when the phrenic nerve is stimulated, and when the stimulus is removed they almost as instantaneously disappear In the pain that we are considering the reaction that occurs in the skin is both rapid and reversible

Such a mechanism as I have suggested would provide a simple explanation of the referred pain felt on stimulation of the phrenic nerve and its modification by anaesthetizing the skin without any need for invoking the theory of an irritable focus in the spinal cord One would hazard the guess that the afferent nerves from the gastro-intestinal tract may prove to be devoid of efferent collateral fibres running out to the superficial layers of the abdominal wall, and that this discovery, when it is made, will add an anatomical feature to the physiological argument for regarding them as a special group of nerves

Peritoneo-cutaneous Radiation in the Abdominal Wall

A study of phrenic pain leads us inevitably to the conclusion that a precisely similar peritoneo-cutaneous radiation occurs in the superficial nerves of the anterior abdominal wall when the underlying parietal peritoneum receives a painful stimulus from an inflamed viscus or inflammatory exudate Infiltration experiments with novocain again confirm this conclusion It is easily demonstrated, for instance, that the localizing pain in acute appendicitis or acute cholecystitis is greatly modified or completely abolished by inducing local anaesthesia by subcutaneous infiltration of the area in which the pain is felt These experiments have been urged in support of Mackenzie's theory of a viscero-sensory reflex (Weiss and Davis, 1928), yet, as we have seen, there are good reasons for the belief that the visceral afferent nerves are in no way involved, but only the afferent nerves from the parietal peritoneum

The sensitivity of the parietal peritoneum is so extreme that it is hardly adequate to say that it reacts to the stimuli that produce pain on the surface of the body The fact that we can elicit pain by touching the diaphragm with a gloved finger, and the occurrence of severe peritoneal pain from effusions of blood and blood clot in the intraperitoneal haemorrhage, demonstrate that the sensitivity of the parietal peritoneum is more closely analogous to that of the cornea than to that of the skin.

Definition of Referred Pain

Holding as I do that true visceral pain in the intraperitoneal organs is in no sense projected to the surface of the body, and that Mackenzie's theory of a viscero-sensory and viscero-muscular reflex is unsound so far as these organs are concerned, I suggest that a more precise and just definition of referred pain is required That much-abused term is commonly held to mean pain felt at a point remote from the seat of stimulation Under this definition the hypogastric pain resulting from a carcinoma of the splenic flexure of the colon would be a referred pain, but I have already argued that it is merely imperfectly localized and in no sense referred I suggest, therefore, that we limit the term ' referred pain " to pain resulting from stimulation of a somatic sensory nerve and referred to a remote part of the distribution of that nerve or of the segmental sensory distribution with which it is connected This definition covers such well known examples of referred pain as that felt in the knee in disease of the hip joint, or as the striking experiment of Sir Thomas Lewis in which stimulation of nerve endings inside his *maxillary antrum caused referred pain and hyperalgesia* in the whole distribution of the second division of the trigeminal nerve

Referred Pain in the Urinary System

Under this more precise definition of referred pain we must include pain radiating to the testis resulting from renal or ureteric colic, or felt in the end of the urethra from stimulation of the trigone of the bladder It must here be emphasized that the interior of the pelvis of the kidney and the ureter are sensitive to mechanical stimuli, as is the base of the bladder These organs are therefore, by definition, innervated with sensory nerves of a different physiological group from the afferent nerves of the gastro-intestinal tract, since they respond to the common type of pain stimulus Thus it need cause us no surprise that they should give rise on stimulation, as they undoubtedly do, to both viscero-muscular reflexes and viscero-cutaneous referred pain

Angina Pectoris

A very limited personal experience of this condition precludes me from speaking with authority on the mechanism of pain in angina pectoris but I must refer

young men on whom will fall the burden of future leadership in various fields, and conducted by means of its own field staff of about seventy public health experts researches in yellow fever, malaria, tuberculosis, diphtheria, influenza, and other diseases About one-third of the funds were appropriated for projects outside the United States, the work extending over fifty-three countries, with a geographical range from Scandinavia to Java The International Health Division of the Foundation conducted its work in thirty home States and forty-one foreign countries on a budget of a little over £400,000 The greater part of this amount was spent on laboratory and field services and on the control and investigation of specific diseases, about one-fourth was devoted to public health education and to the aid of State and local governments in setting up model health centres and administrations

One outstanding piece of work, to which the word " dramatic " might well be applied, is that on yellow fever It had been assumed, too soon, that the battle against yellow fever was as good as won Then, almost without warning, the South American jungle " struck back," and the epidemiological strategy had to be completely altered Vast areas of the hinterland of both South America and Africa have been found to be endemic centres of " jungle yellow fever," which, in the absence of adequate methods for its control, must be regarded as a permanent source of virus for the reinfection of cities and towns where high densities of the *Aedes aegypti* mosquito (called the *Stegomyia* mosquito in the early days) are tolerated In 1936 the Rockefeller Foundation spent some £60,000 in attempting to solve this new problem of yellow fever It is at the moment co-operating with the national health departments of Brazil, Colombia, and other South American countries in control or investigation or both, it is prosecuting research at its own laboratories in New York, and, by invitation of the British Government, is making a study of jungle yellow fever in East Africa The bright spot in the situation is the development in the laboratories of the International Health Division of a method of vaccination which has successfully protected the field and laboratory staff working on this disease No case of yellow fever has occurred amongst them for six years, although, before the vaccine was available, five scientists on the staff died of yellow fever " Science, like war," says the president of the Foundation, Raymond B Fosdick, " has its heroes, but they fight for causes that are generally better worth dying for "

Recently the Foundation has turned to the assistance of mental hygiene—" the most backward, the most needed, and potentially the most fruitful field in medicine to-day " In this as in all its programmes the Foundation places its eggs in more than one basket Thus it is financing work on genetics, neurology, psychiatry, child psychology, and similar subjects in various American universities and institutions, as well as in the universities of Copenhagen, Amsterdam, and Leiden, and in Maudsley Hospital and the Galton Laboratory of the University of London On this effort, again, about £250,000 was expended in 1936 Wherever one turns in this report one finds the same record of activity, significant not only because of its largesse but because of the discrimination with which it is distributed Twenty-seven grants were made to workers in the field of endocrinology One of these went to the University of California, to a group of workers engaged on research on the anterior pituitary, another to Harvard, where research is being conducted on the sex hormones, a third to the Philadelphia Institute for Medical Research, where studies are being made on the effect upon growth of extracts of the thymus and pineal glands

One other piece of work which the Foundation has assisted will give pleasure to all who feel sadness at the spectacle of scholars in exile Last year there was published in London a list of 1,639 German scholars who had been dismissed from their posts—men who had held positions as teachers and research workers in institutions throughout Germany These men, representing over sixty academic disciplines, included Nobel prize winners and figures of international distinction Many of them were Jews or had Jewish connexions, others were pure " Aryan," but had convictions which had made them unacceptable to the present German Government At the time the report was issued about half of these exiles, scattered in forty-six different countries, had found positions in academic and scientific institutions in the land of their adoption The Foundation has granted over £100,000 on behalf of 151 individual scholars The report is full of excellent projects which have been assisted by the Foundation We confess that we should like to see another report on the applications which have been turned down We are told only that during 1936 nearly 1,000 applications for aid had to be declined These included 270 research projects, twenty-four public health projects, and seventy-four " cures, remedies, and investigations of theories " This last figure strikes us, in view of the fame of the Foundation and the vast number of people who have " cures " or remedies, not to speak of theories, in need of financial help, as extremely modest

briefly to an important recent contribution by J C White of Boston (1935) on this subject White has shown that the pain of angina pectoris and of aneurysm of the aortic arch can be abolished by injection with alcohol or surgical excision of the upper five thoracic sympathetic ganglia and by division of the upper five posterior thoracic spinal roots Experimental confirmation was obtained in dogs By passing a silk ligature under the left coronary artery and bringing it out through the chest wall in a glass tube temporary occlusion of the coronary could be produced with ease and gave rise to obvious signs of cardiac distress within a few seconds When the four upper pairs of thoracic ganglia were excised, or the upper five pairs of posterior spinal roots divided, the occlusion caused no manifestations of distress Division of the vagi the upper six intercostal nerves, and bilateral stellate ganglionectomy all failed to prevent the discomfort, and it is plain that the afferent pain fibres from the heart pass through the thoracic cardiac nerves entering the upper five thoracic segments

White believes that cardio aortic pain is produced in part by the viscero cutaneous reflex postulated by Mackenzie but also in large part by direct transmission over visceral afferent pathways or in other words as a true visceral pain He gives both clinical and experimental evidence against the axon reflex as a factor in cardiac pain

Dual Mechanism of Abdominal Pain

Whatever the ultimate truth may be as to the mechanism of referred pain in angina I think we must admit the probability that it differs fundamentally from the mechanism of pain in the gastro-intestinal tract In that tract we have certainly a dual mechanism. On the one hand we see true visceral pain as part of a defence against the threat of obstruction It is primitive in the scale of evolution is in no sense referred to the superficial somatic nerves and is imperfectly and vaguely localized On the other hand we find referred pain the stimulus for which arises not from the visceral afferent nerves at all but from the somatic nerves of the parietal peritoneum It has been evolved as a protection against bacterial infection of the peritoneum either by penetrating wounds from without or by perforation of the intestine within It is later in the scale of evolution and produces a radiation of pain to the superficial somatic nerves and a reflex protective rigidity of the overlying muscles both of which are accurately localized

In a report issued as Water Pollution Research Technical Paper No 6 by the Department of Scientific and Industrial Research (H M Stationery Office 12s 6d) a detailed description is given of the results of a chemical and biological investigation of the non tidal reaches of the River Tees This investigation which occupied about four years formed part of a comprehensive chemical biological and hydrographical survey of the whole of the river and its tributaries from its source to the sea. The object of the survey was to obtain data on the effects of the various discharges of sewage and trade effluents on the river and on the extent to which these liquids should be purified before discharge if serious pollution of the river water is to be avoided

BRUCELLOSIS IN MAN AND ANIMALS IN STAFFORDSHIRE

LABORATORY OBSERVATIONS

BY

JOHN MENTON, L R C P & S I

Bacteriologist to the County of Stafford

The incidence bacteriology and epidemiology of undulant fever vary in different countries In many lands the disease is more prevalent than in Great Britain On the Mediterranean littoral *Br melitensis* predominates In the United States of America *Br melitensis Br suis* and *Br abortus* all occur In this country *Br abortus* prevails The animal vectors also show geographical variation In southern Europe the goat is pre-eminent In America the goat, pig cow and sheep play a part In England the cow is considered the main reservoir of infection, for although horses suffering from poll evil and fistulous withers also harbour Brucella they are not regarded as of grave epidemiological importance While these fundamental differences are clearly recognized and accepted there are other discrepancies which arise from unstandardized and varied techniques Also a great deal of work remains to be done in this country on the comparative aspects of brucellosis in relation to human infection and the findings and conclusions of distant authorities are often accepted too readily as applying universally

The aims of this local investigation were (A) to ascertain the prevalence of agglutinins to Brucella in the sera of man and of some of the animals presumed to have been in contact with infected cattle (B) to assess the accuracy of the agglutination test as a diagnostic procedure (C) to find out the incidence of Brucella organisms in the milk of the cow and of the goat (D) to investigate the species and virulence of the organisms recovered

A Serological Investigations

Three different antigens were used in this investigation standardized Oxford suspensions a local laboratory strain and the special antigen used by Huddleson (1932) in his rapid method of field testing

Human Sera—These specimens consisted of two groups (I) those taken from patients suffering from or with a recent history of an infection causing pyrexia and submitted to the laboratory for the routine Widal reaction (II) those from people with no history of recent infection with fever

Group I comprised 500 sera Fifty reacted to *Br abortus* ninety-eight to different members of the typhoid paratyphoid salmonella-dysentery group and the remainder were completely negative to all the twenty seven micro organisms used in the routine tests. The fifty sera agglutinating *Br abortus* reacted in the following titres

TABLE I

1–5	1 50	1 125	1/250	1 500	1 1 250	1/2,500	1 5000
6	9	5	2	5	15	4	4

Group II consisted of two batches of 500 sera one examined in 1932–3 and the other in 1937 They reacted to *Br abortus* in the following numbers and dilutions

TABLE II

Years	1 25	1 50	1 1–5	1 100	Negative
1932 3	—	1	3	1	495
1937	3	2	—	—	495

FOOD POISONING

The usual season for cases of bacterial food poisoning has passed with only one extensive outbreak that in the St Pancras and Finsbury districts which was recorded in our issue of September 11 (p 541) The Gaertner bacillus was isolated from numerous cases and from samples of the incriminated food in this epidemic but certain features of it notably the very short incubation period in some cases led Dr P V Pritchard deputy medical officer of health for St Pancras to suggest that the food concerned may also have contained toxins possibly produced by other bacteria In the large majority of cases of food poisoning living bacteria of the Salmonella group are not found and the nature of the agent responsible often remains in doubt Two specific toxins can undoubtedly cause an enteritis—the endotoxin of organisms of the Salmonella group which have been killed by cooking and an enterotoxin produced by certain staphylococci usually in milk or confectionery What remains doubtful is how many other bacteria can be specifically connected with food-poisoning in the sense that they themselves or their characteristic products can cause an enteritis apart from any incidental products of decomposition caused in a particular food by their growth This and other more obscure aspects of food poisoning were well reviewed by E R Jones[1] in this journal some months ago Among the bacteria which he mentions as having been incriminated *B coli Proteus vulgaris* and *Streptococcus viridans* must always be somewhat unconvincing as mere discoveries in suspected food unless present in such large numbers that they must clearly have multiplied considerably in the food itself even so interpretation of such a finding is difficult Jones also discussed at length the means by which food can be contaminated with organisms of the Salmonella group The facile assumption upon which the investigator has often to fall back—that the excreta of rats or mice are responsible—is well supported by studies of the frequency with which these animals harbour such bacteria Rodents are the chief natural hosts of this group of micro organisms while the infection occurs also in pigs cattle and even in certain birds ducks eggs are sometimes infected and many serious outbreaks have been caused by meat from emergency slaughtered animals It is not perhaps universally known that so called rat viruses are suspensions of living bacteria belonging to the Salmonella group and although their purveyors claim that the strains used are harmless to man and domestic animals authorities in this country do not accept this assurance It would be interesting to know whether any recent cases of enteritis have been considered attributable to this source Another danger is the human carrier and if such carriers are in fact more common than is generally supposed it is perhaps surprising that outbreaks of infective enteritis are comparatively rare A review of this subject has also recently been made by E M Robinson writing in South Africa and is accompanied by a paper by D G Steyn on food poisoning due to other than bacterial causes which are classified as minerals preservatives and dyes and toxic substances normally present in certain foods of which a remarkably long list is given The frequent mention of various Salmonella types in these papers reminds us that many individuals and places have given their names to different serological types of this micro organism It is one of the anomalies of bacteriological nomenclature that among these bacteria alone serological differences of the most abstruse kind should be held to indicate difference of species and large numbers of otherwise indistinguishable bacteria some of which have been encountered only once perhaps never to be seen again consequently masquerade under separate names This is a picturesque system but confusing and inconsistent the numbering by which different serological types of pneumococci and streptococci are denoted is both simpler and more rational

ROBIN AND JOHN ADAIR

Dr Archibald Malloch librarian of the New York Academy of Medicine and a follower of the Osler tradition of medical history has given an interesting address[1] on these two surgeons and cleared up the curious case of possible misrepresentation in Benjamin West's well known picture of the death of General James Wolfe who died of wounds on the Plains of Abraham outside Montreal on September 13 1759 It has been thought that Robert Adair was painted in West's picture but he never served in Canada whereas John was at Montreal at the time Robert (Robin) now more famous in song than in surgery though he became serjeant surgeon to George III and surgeon to the Chelsea Hospital was known in London whither he migrated from Dublin as the fortunate Irishman and was said 'to have played the devil with the women His luck began directly he landed on this side of the Irish Channel for he attended Lady Caroline Keppel injured in a carriage accident She was much taken with him recommended him to her many friends in London married him and wrote the well known song Robin Adair set to the Irish tune of Eileen Aroon (Ellen the secret treasure of my heart) of the fourteenth century Members of the British Medical Association may remember that when at the Dublin meeting (1933) the fellowship of the Royal College of Surgeons in Ireland was conferred on Professor Dean Lewis of the Johns Hopkins University Baltimore a pleasant feature was that Robin Adair as the first Honorary Fellow of the College was sung as part of the ceremony

THE PSYCHOLOGY OF ASTHMA

The problem of asthma has been tackled from most aspects and by many experts and now it is receiving the attention of the psychologists Nor is this surprising The psychological element is undoubtedly an impo tant

[illegible] *Brit Med J* 1937 2 13 57

Of pyrexial patients 10 per cent. showed agglutinins to *Br abortus* as compared with 1 per cent of those not giving a history of recent rise of temperature

Animal Sera (Sheep Pigs, Rats, and Poultry).—The different classes of sheep included two rams which were negative, 372 were under 3 years of age, and 203 were 3 years or older The pigs were aged 6 to 9 months with the exception of three sows which were over 3 years old The estimated ages of the rats ranged from 2 months to 3 years and the hens among which the doubtful positives occurred fell within the age group of 16 to 18 months The sheep and pig sera were collected from slaughterhouses dealing with good quality animals The serological reactions of these animals were

TABLE III

	Number Tested	+	Titre of Agglutination for *Brucella abortus*				
			1/10	1/25	1/50	1/125	1/250
Sheep	575	21	2	9	7	—	3
Pigs	920	20	8	10	2	—	—
Rats	200	—	—	—	—	—	—
Poultry	100	2	2	—	—	—	—

The 1 in 10 reactions have in the meantime been included among the positives

B The Relation of Active Infection to the Presence of Serological Agglutination

As it would be difficult to conduct exhaustive culture work on patients and animals away from the laboratory, guinea-pigs were utilized for this part of the investigation It is not claimed that the reactions of small laboratory animals are exactly comparable to those of man and the larger animals, but there is every reason to think that the advantages of controlled experiment far outweigh the other considerations

Seventy-five cavies were killed six weeks after inoculation with infected milk sediment, the blood sera collected, and cultures sown, in some instances from the spleen and other large organs, the lymph glands, and the bone marrow As the investigation proceeded it became evident that positive cultures were more likely to be obtained from the spleen, bone marrow, and lymphatic glands than elsewhere The following serological reactions to *Br abortus* were obtained in the sera of those animals from which this micro organism was recovered

TABLE IV

Negative	1/25	1/50	1/125	1/250	1/500	1/1,250	1/2,500	1/5 000	1/12,500
3	2	4	12	6	24	11	6	6	1

It is interesting that three sera—that is, 4 per cent of the total actually examined—were completely negative serologically The wheys of the three inoculated milks in these instances were also negative, but so were thirty-two of the other wheys, which produced positive cultures and agglutination titres in the animals varying from 1 in 25 to 1 in 5,000 There was not much correlation between the agglutinin content of the wheys and that of the sera when the wheys were positive The lapse of six weeks, and the fact that mainly milk sediment and not actual whey or milk was inoculated, ruled out any passive transference of whey agglutinins

C Incidence of Brucella in Cows' and Goats' Milk

Cows Milk.—Several batches of cows' milk were investigated some time ago Over 1,000 samples were tested biologically and *Br abortus* was recovered in 5 per cent It was then felt that the efforts to isolate the organism had not been exhaustive enough, and recently of 397 guinea-pigs inoculated with the sediments of routine milk samples for the purpose of excluding tuberculosis 6 3 per cent. revealed the presence of *Br abortus*

Goats Milk.—Fifty seven samples of goats' milk from different parts of the country were found to be devoid of whey agglutinins and failed to produce any serological reactions to *Br abortus* or positive cultures in guinea-pigs

D Species and Virulence

All the strains proved by differential tests to be *Br abortus* One hundred per cent. of the organisms tested behaved consistently to the carbon dioxide and to the bacteriostatic dye tests in primary culture (Huddleson, 1934) Three failed to produce hydrogen sulphide, but the remaining strains reacted to this test according to rule The glucose utilization test of McAlpine and Slanetz (1928), although cross checked by the Somogyi and Benedict methods, showed many discrepancies

Of the seventy-five guinea-pigs from which the micro-organism was isolated six weeks after injection only 32 per cent showed macroscopic pathological changes, and these were limited to enlarged spleen and lymphatic glands, but many of the animals which showed no naked-eye changes had in various organs small mononuclear accumulations which were discernible microscopically All the lesions caused by infected milk were slight compared with those resulting in a guinea-pig inoculated with a strain from a dead calf foetus This animal developed extensive proliferative lesions, haemorrhages, abscesses, and areas of necrosis three weeks after inoculation

Discussion

The results obtained from the sera of people suffering from pyrexia were interesting, and illustrated the value of including a test for undulant fever in all routine diagnostic work Atypical clinical forms of this disease were fairly frequent, and the symptoms were so protean that they were sometimes attributed to typhoid fever, tuberculosis, chronic rheumatism, or even neurasthenia Two of the fifty positive sera were from children aged 7 and 8 years respectively, and these patients were suffering from undulant fever at the time of test These facts are mentioned as some authorities believe that this disease is very rare in childhood The low percentage of positives in Group II sera correlated to some extent with the results obtained by Hardy, Jordan, Borts, and Hardy (1931), who obtained in Iowa 1 3 per cent reactions in dilutions over 1 in 20

That nineteen of 575 sheep reacted to titres of 1 in 25 or over came as a surprise, for while in France and other countries these animals are often infected, yet in England they are regarded as almost free from the disease In the United States and Denmark, where *Br suis* occurs, pigs are heavily infected Huddleson, Johnson, and Hamann (1933) consider that the incidence varies from 0 to 23 per cent in different parts of the United States Gwatkin in Canada (1931) found among 501 sows 0 6 per cent positive and 0 8 per cent suspicious In this country very few positives have been as yet reported, but in the present investigation 1 3 per cent of young pigs reacted in a dilution of 1 in 25 or more

Karkadinovsky (1936) examined thirty-four wild rats from infected farms and isolated *Br abortus* from eleven Many of my group of 200 rats came from infected farms and from a slaughterhouse where infected animals were killed, and not even one suspicious agglutination reaction

factor in asthma, and the nervous mechanism involved and the anatomical structure used for the final discharge both respond to emotional stimuli Dr E B Strauss,[1] in a study of the psychogenic factor in asthma, investigated thirty unselected cases at the psychiatric out-patient department at Guy's Hospital in order to determine the presence or absence of "nervous" psychic, or emotional factors in the asthma syndrome He used a special method of approach by which he evaluated each case in accordance with a "ten-point scale" This has, he says many features in common with Culpin's six-point scale, but he elaborated it independently He found that the "nervous" element was strongly present in sixteen cases, well represented in nine, and feebly but definitely represented in four He failed to detect it in only one case One of his conclusions is that to classify asthma as a psychoneurosis is an error The furthest one can go is, he thinks, to say that even when the allergic diathesis is present psychic factors contribute more than has usually been supposed Their contribution takes various forms Asthma is sometimes complex-determined—that is, it is a form of conversion hysteria Other patients who are by temperament social misfits in a greater or less degree are likely to develop asthma Others again, make their asthma the centre of their life in Jung's idiom they cultivate the asthmatic persona, they can "turn on" their asthma whenever it suits them Allergic patients who live in conditions of extreme emotional strain may develop the syndrome, and, lastly, asthma in an allergic subject may be part and parcel of a general anxiety state an autonomous reflex outlet for emotion bottled up at high pressure If these conclusions are justifiable he suggests, psycho therapy should be used to reinforce desensitization, breathing exercises and other physical methods Its form should be determined by the case-history Dr J L Halliday[2] also examined thirty consecutive patients, who came to him in his capacity of medical referee under the Workmen's Compensation Acts and whom he afterwards studied as a private inquirer He views the asthma syndrome broadly as a sign of failure of adaptation to environment. He is very cautious about deducing anything from his limited material, but puts forward some useful hints for the treatment of patients and the key questions to ask them—for example about their circumstances at the time of the primary attack, their attitude, various aspects of their life and their opinions about their health, and especially about respiratory disease He finds that the primary attack occurs most often in the earliest years there is a gradual decline until the age of 20, a slight rise to about the age of 30, and then a decline again In the earliest years males predominate in the proportion of two or three to one, but from puberty onwards the sex incidence is fairly even Dr Halliday suggests a very long and detailed series of questions to be answered in a future essay The most important features of the emotional reaction are, he considers innocence, increased suggestibility, and unconscious purpose and an understanding of these is necessary Dr A Kerr Clarkson[3] has recently published a prize thesis on a much larger series—300 cases of asthma seen in general practice He finds that a number of psychic factors are common in a varying degree to nearly every case The first of these is the intensification of emotion as an integral part of autonomic disharmony by allergic or biochemical factors In a certain proportion of cases the psychological phenomena in asthma depend entirely, he says on a disordered biochemistry If this factor is not adequately treated the intensity of the emotional life tends to be perpetuated It reaches its maximum when the allergic balance is unstable Moreover, the patient tends to establish a habituation reflex the primary nuclei of which are grouped around fear This reflex may be used, according to the temperament of the child, as a retreat into illness or a psychopathic way of retreat from reality The sense of organ inferiority can energize emotion into a physical expression Frequent repetition of the original stimulus leads, he says, to diffuse psychic derivatives, which eventually permeate and colour the life of the individual and can at any point lead to an attack This factor more than any other explains for him the freakishness of asthma Where the psychic factor predominates he finds therapy prolonged and uncertain In a small but definite proportion of cases he finds that asthma is the expression of a psychosis It would be a mistake to underrate the importance of this and much other careful work It shows that research into the psychic causes of asthma is still in an introductory stage

EMPIRE RHEUMATISM COUNCIL

The Empire Rheumatism Council whose object is to organize research throughout the British Empire into the causes and means of treatment of rheumatic disease, was constituted in October, 1936, with the Duke of Gloucester as president A report on the work of the first year has now appeared over the signature of the chairman Lord Horder who presented it at the annual meeting on Monday The Council was faced at the outset with an onerous task in overcoming public apathy and lack of knowledge as to the ravages by this group of diseases on the health and economic well-being of the community Notwithstanding the difficulties real progress has been made, so that to day Lord Horder can claim that the education of the British public in the matter of rheumatic disease is steadily progressing The Council acknowledges the active sympathy and support it has won from public authorities, from the newspapers, and from organizations interested in the health of the people The chief administrative officers of the Ministry of Health have been unsparing of good counsel and statistical facts, while the medical members of the House of Commons have formed a group to assist the aims of the Council Arrangements have been made for setting up immediately two research fellowships The lack in London of a specialized in-patient rheumatism hospital is a serious handicap to the carrying out of research plans, but after close consideration the Executive Committee

was obtained, but further work must be done before asserting that rats play no part in the spread of this disease

The two positive reactions of 1 in 10 in hens were of no significance According to Beller and Stockmayer (1933) normal fowl sera may contain agglutinins to *Br abortus* On the other hand Emmel and Huddleson (1929, 1930) consider that poultry infection is common in the United States Italian observers have reported a *melitensis* infection in poultry in Messina, and Dubois (1931) a similar infection at Nimes contracted from sheep

When the diagnosis was definitely established in guinea-pigs by culture the agglutination test showed an accuracy amounting to 96 per cent A 1 in 25 reaction may indicate a very recent or an old infection, and to establish the diagnosis repeated testing is necessary in all low titre agglutination, combined with the estimation of the opsono-cytophagic index and attempts to isolate the micro-organisms, although the significance of low titre agglutination can often be settled by repeated serological examination alone

Many infected milks may be devoid of whey agglutinins, as shown in this investigation and agglutination tests on milks have not the same diagnostic value as the serological reactions The percentage of milks yielding Brucella in culture was small Starr (1934) estimates that 20 to 50 per cent of cattle in the United States are infected As this investigation was coincident with the biological test for tuberculosis the milk sediments only were injected and many Brucella go up with the cream during centrifugalization The cream was however, repeatedly broken

Although the goat is pre-eminently the host for *Br melitensis* it can deal effectively with moderate doses of *Br abortus* and makes a quick recovery when so infected In this investigation the negative findings suggest that goats in this country are in a similar position to those in Sweden Henricsson (1931) considers that the goat is not responsible for undulant fever in Sweden This disease is most prevalent there in the middle and south west parts where goats are seldom seen The goats are kept in north Sweden where undulant fever is rare Goats sera from different parts of that country were negative to agglutination and complement fixation

The statement that a supposed *melitensis* infection was said to have been acquired from a goat in England a few years ago cannot be maintained for in the light of present-day knowledge and simply judging by the details actually reported there was no evidence that either the patient or the goat had undulant fever The apparent freedom from Brucella infections of goats in this country is of the utmost importance from the economic point of view

All the strains isolated in the present investigation were *Br abortus* (*Br suis* and *Br melitensis* can infect cows and appear in the milk) They were only mildly pathogenic to the guinea pig even when administered parenterally The prevalence of such strains may explain the comparative rarity of human infections and perhaps other factors such as the diluted dosage in bulk milks and the bactericidal effects of the gastric juice may play their parts

Before concluding I would like to make a plea for closer co-operation between the medical and veterinary professions in dealing with animal diseases which are communicable to man With the disease under discussion this is essential otherwise the public health and economic aspects may each become segregated with ultimate detriment to both Most veterinary authorities are agreed that infected cows do not go on aborting indefinitely but after one or two abortions they may settle down and produce healthy calves The quantity of the milk may then be unimpaired and the animals may appear healthy Investigation has shown however, that such milk may contain Brucella so that for once in a way economics and public health do not seem to go hand in hand In Staffordshire co operation has been close and the carrier condition has received some attention and it may be that the harmonious co ordination of the medical staff the veterinary surgeons and the farmers has contributed to the small percentage of infected milks revealed during this research

Summary

1 Of sera from pyrexial patients 10 per cent agglutinated *Br abortus* Samples from people who were not pyrexial showed 1 per cent positives Nineteen of 575 sheep and twelve of 920 pigs reacted in 1 in 25 or higher The sera of 200 rats and 100 poultry showed no significant agglutination

2 In animals yielding positive cultures the accuracy of the serological agglutination test reached 96 per cent Many infected milks did not contain agglutinins

3 *Br abortus* was recovered from 6 3 per cent of samples of cows milk No positive cultures were obtained from fifty seven samples of goats milk

4 All the strains of Brucella isolated were *Br abortus* and all exhibited a low degree of virulence for the guinea pig

My thanks are due to Dr T V Cooper and Messrs F W Duke W H Fussell and N H Johnson of the laboratory staff to Messrs. H R Rylands and A Thompson of the county staff to the medical practitioners, veterinary surgeons farmers and those interested in the meat trade to the members of the British Goat Society and to Miss D Evans for her help with the MSS

N Carrara and A Previtera (*Pediatria* Naples September 1 1937) record their observations on the relation of the type of *C diphtheriae* to the clinical course of the disease in twenty eight cases their conclusions being as follows (1) the classification of the types of *C diphtheriae* adopted by Anderson and his co-workers should be accepted with reserve especially as regards the suggested existence of a relation between the individual types of the organism and the course of the disease (2) the isolation of the so-called *gravis* type has not settled the problem of malignant diphtheria other factors connected with the constitution and with treatment and immunity are of much greater importance (3) in view of the great variations in the results obtained by different observers further examination of the problem on a large scale is desirable

has decided that it is not wise at present to aim at raising the very large sum necessary for that purpose The alternative plan has been followed of promoting arrangements with existing hospitals in the London area for establishing specialized rheumatism wards with facilities for the Council's research workers 'Our ideal for the United Kingdom is the formation of a group of affiliated councils each controlling a homogeneous area containing one or more university medical schools and where possible, having close association with one of those British medical spas the high value of which is not yet sufficiently appreciated by our people Development of research work within the London area will not be permitted to lose sight of the ultimate aim of a co ordination of effort carried on at the most useful centres and avoiding overlapping' In addition to research into causative factors a wide field is open for concurrent work in therapeutic research The aim will be to arrive at a standardized system of treatment applicable to the great majority of sufferers from the various forms of rheumatic disease and capable of utilization on a national scale 'Our plan of campaign is based on what I regard as the only sound scientific principle—that of investigating methodically every possible factor in the causation and treatment of rheumatic disease We are being approached from many quarters by groups or individuals who insist that there is but one key to the problem of rheumatic disease a key that is in their keeping We must resist their importunities however well intentioned they may be and decide to explore the whole field' These are wise words

ACTION OF ALCOHOL ON CEREBRAL CIRCULATION

Various technical difficulties have made the study of the factors controlling the cerebral circulation one of exceptional difficulty but in recent years intensive research on this subject has been carried out at Boston Loman and Myerson[1] concluded that the two chief factors regulating the flow of blood through the brain were the general arterial pressure and the calibre of the cerebral vessels They found that a drug such as adrenaline might cause decreased cerebral flow when given in small doses because of its local vaso-constrictor action with larger doses the blood flow increased when the rise in general pressure overcame the local vaso-constriction Since the actual cerebral circulation depends on two separate and frequently opposing factors the net result of any drug can only be determined by direct experiment. Thomas has recently investigated in cats the action of alcohol on the cerebral circulation—a subject of considerable importance Doses of about 1 c.cm absolute alcohol per kg were injected intravenously Since the injections were given rapidly (2 minutes) the concentration in the general circulation was probably at least 5 mg absolute alcohol per c.cm of blood—a concentration which would produce coma in man. This dosage of alcohol resulted in a dilatation of the pial arteries which was independent of any change in the general systemic arterial pressure The pressure of the cerebrospinal fluid was raised and the flow of blood through the brain increased Moreover it was noted that the colour of blood in the cerebral veins changed from blue to red These results show that the depressant action of alcohol on the brain cannot be due to any interference with the supply of oxygen by the circulation though they are not opposed to the hypothesis that alcohol diminishes the oxygen uptake of the brain It is of interest to note that according to Loman and Myerson ether and alcohol have similar actions on the cerebral circulation but that as was shown by experiments with amytal this action is not characteristic of all narcotics

PERSPECTIVES IN BIOCHEMISTRY

Of the many possible ways of marking such an auspicious occasion as the seventy fifth birthday of our most distinguished biochemist, Sir Frederick Gowland Hopkins none could have been more felicitous than that of presenting him with a book of essays by past and present members of his laboratory[1] The respective authors briefly discuss some of the most recent work in their own specialized fields and given liberty on editorial authority to make their essays provocative as well as suggestive proceed to propound their views as to the most likely directions of further advance The variety of subject is such that practically every branch of biological science is represented, and a number of papers have a definite clinical interest—for example those under the headings 'Calcium and Blood Coagulation' 'Biochemistry and Mental Disorder' and 'Vitamin C and Infection' As a broad generalization the contributions made by the "past" members—some of whose reflections are of a more personal character flavoured with an occasional reminiscence—are the more successful and make the better reading Many of the present staff have been less happily placed in having subjects which do not lend themselves well to essay form, and some of their pages are rather heavily dressed with formulae If the essays on the whole cannot be considered as highly provocative there is much in them that is both suggestive and stimulating and to the reader there is the further attraction that he is privileged to join company with those who have united to pay a fine tribute to a great man of science

The Secretary of the British Medical Association receives requests to appoint delegates to various conferences which take place in the summer months He would be glad to have early information regarding proposed visits by members to places abroad during the coming year

Clinical Memoranda

Acute Bacillus Pyocyaneus Meningitis. Spontaneous Recovery

The following case occurred in a surgical ward at the Brompton Hospital

CASE RECORD

The patient, a woman aged 31 had an attack of right sided pleurisy in 1923 and nine months later a tuberculous empyema was drained, which healed after one year The patient was transferred to a sanatorium and remained well until 1935, when an abscess burst beneath the right breast The empyema was redrained by resection of portions of the fifth and sixth ribs but failed to heal and in February, 1937, a partial thoracoplasty was performed by resection of portions of the sixth to ninth ribs inclusive back to but not including the transverse processes of the vertebrae At this time there was a secondary infection of the empyema cavity with the *Bacillus pyocyaneus* By April the empyema cavity had been reduced in size to a narrow track, and on the ninth of that month this was laid widely open and packed with gauze On the eighteenth the patient complained of headache and her temperature was 99 and pulse 110–120 Two days later the headache became worse, and was accompanied by stiffness of the neck and a sore and tender feeling over the scalp There was no head retraction, and the fundi were normal no abnormal physical signs were observed in the central nervous system The temperature had now risen to 102 5 and the pulse to 120–130 On April 22 the condition was unchanged Lumbar puncture gave a pressure of 300 mm of water the fluid was opalescent, and a small coagulum formed on standing An excess of cells (polymorphs and lymphocytes) was present. Chlorides amounted to 720 mg per 100 c cm , globulin was normal and no tubercle bacilli were found. Culture revealed a pure growth of *B pyocyaneus*

On the twenty sixth the patient became drowsy, her temperature was 101 –102° and pulse 110 Lumbar puncture was repeated the pressure now being 200 mm The first few cubic centimetres of fluid withdrawn were pure pus , subsequent fluid was turbid, and a heavy deposit of pus formed on standing. Chlorides amounted to 720 mg per 100 c cm. and there was a slight increase in globulin No tubercle bacilli were found but a heavy growth of *B pyocyaneus* was seen on culture Headache was not so severe on the twenty eighth , the temperature was then 100° and the pulse 110 On the thirtieth lumbar puncture revealed a normal pressure, but pure pus was withdrawn through the needle, followed by turbid fluid , cells numbered 1,600 per c mm , all polymorphs Chlorides remained at 720 mg. per 100 c cm , there was a slight increase in globulin, and the sugar content was 0 029 gramme per cent. Culture gave a pure growth of *B pyocyaneus* A blood culture was sterile after ten days On May 1 the headache had gone but the scalp was still tender, and the patient was feeling well Temperature and pulse were normal On May 7 a lumbar puncture was done the pressure was normal and the fluid clean there was a slight excess of cells with a few polymorphs. Chlorides were 720 mg. per 100 c cm , and sugar 0 044 gramme per cent. Culture was sterile

COMMENTARY

Symptomatic treatment only was employed throughout At no time were there any abnormal physical signs in the central nervous system, nor have there been any nervous sequelae following the attack of meningitis The empyema has almost healed but remains secondarily infected with the *B pyocyaneus* We have been unable to find any mention in the literature of a *B pyocyaneus* meningitis

STATISTICAL METHODS

An Introduction to the Theory of Statistics By G Udney Yule C.B E., M.A. F R S and M G Kendall M A Eleventh edition, rewritten and revised (Pp 570 55 diagrams, 4 folding plates 21s net.) London Charles Griffin and Co 1937

The appearance of an eleventh edition of Mr Yule's *Introduction to the Theory of Statistics* in an enlarged form and with a second name, that of Mr M G Kendall, on the title page is an event which requires more than the routine word of commendation with which successive editions of textbooks are generally greeted "Every man s affairs, however little, are important to himself," and, having been associated with Mr Yule by ties of friendship and common scientific interests since before the publication of his first edition, I am not an impartial judge , but I hope it is not mere self deception to believe that in the last twenty seven years statistical methods have come to occupy a recognized place in medical and biological education, and that the influence of Mr Yule has been great in bringing about this change of attitude

Before Mr Yule s first edition came out most general textbooks were written from the point of view of students of economics , a few valuable books, such as those of Sir Arthur Newsholme and Dr F Prinzing, conveyed instruction of much importance to medical readers, but were stronger on the descriptive than the methodological side Books dealing with method were usually written by mathematicians for mathematical students and ignored the new instruments of research devised by Galton and Pearson With the exception of Dr Davenport's little book, which was rather a laboratory manual than a treatise, an unmathematical medical student or laboratory worker had no guide The publication of the *Introduction* changed all that Mr Yule brought to his task not only competence and experience as a research worker and teacher but an enlightened common sense, which has been eminently characteristic of all his writings His admiration for the work of a master whom no posthumous detraction will deprive of a high place in the temple of fame halted on this side of idolatry , those interested in the archaeology of the subject will find that a great majority of the reservations and objections which called down upon Mr Yule s head if not precisely fire from heaven at least much contumely have been tacitly adopted by most writers, or even made the texts of diatribes very unlike anything Mr Yule wrote More important than this, the recriminations of professional statisticians are very dull Mr Yule had made up his mind to write a book which an intelligent person whose ' mathematics " never rose beyond matriculation standard could understand, and he fully succeeded in the undertaking He excluded a good deal of matter which seemed at the time rather important because it could not be made intelligible without much algebra In subsequent editions sections were added incorporating some of these methods which had stood the test of time yet were not easy to explain briefly, but the ground plan remained With the rapid extension of methods beyond the scope of demography and vital statistics (I am speaking, of course of subjects cognate with medicine) but important in laboratory work and field experiments due to the entry of younger workers well trained in mathematics and interested in statistical methods, the methodology of the science, or art, became more intricate We now have many technical processes which

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

THE USE AND ABUSE OF ANTISEPTICS—II

BY

LAWRENCE P GARROD, M D, F R C P.

AND

GEOFFREY L KEYNES, M D., F R C S

Use of Antiseptics on the Body

The intelligent use of antiseptics in this more difficult sphere demands clear thinking, and it is therefore necessary to distinguish between the different aims with which antiseptics are employed, and to decide whether these aims are in fact attainable at all. In the first place there is all the difference in the world between the prevention of infection by means of antiseptics and its treatment with them treatment takes a number of forms, which may be subdivided into superficial and deep, while prevention may be concerned either with the intact and normal skin or with a recent wound All these types of use present different problems We may first consider the normal skin, and here a distinction is to be drawn between that of the surgeon and that of the patient

Sterilization of the Hands

There are two kinds of bacteria on the skin its normal saprophytic inhabitants, such as white staphylococci, which live actually in its superficial layers, and extraneous and possibly dangerous bacteria whose presence on the surface is due to accidental contamination The removal or destruction of the latter is the object of treating the skin It is plain that roughening of the skin due to repeated scrubbing or to chemical applications favours rather than hinders its colonization by either kind of bacteria The operating surgeon should therefore confine himself to not more than three minutes washing with soap and running water The old-fashioned practice of washing for ten minutes by the clock had its justification as a protest against the carelessness of some of the older surgeons, though it would partly defeat its own purpose by making sodden the superficial layers of the skin and so tending to release the indigenous bacteria The shorter period of washing is not open to this objection, and the scrubbing-brush should be applied to the nails only, as it will tend to damage the smooth surface of well-cared-for skin The hands should then be thoroughly rinsed in spirit to dehydrate the surface of the skin, and dried on a sterile towel An antiseptic is unnecessary, and may tend to injure skin that is at all sensitive Gloves sterilized by dry heat are preferable to gloves boiled and put on wet, since maceration of the skin inside wet gloves is obviously undesirable In emergency, such as in midwifery practice when gloves are unobtainable, an antiseptic application may take their place, dettol cream has been shown to be capable of destroying streptococci on the skin, and has the advantage of being easily carried in a form ready for use

Sterilization of the Patient's Skin

It is generally agreed that before operation the patient s skin should first be thoroughly cleansed with ether soap and water and then dried by the application of spirit The addition of biniodide to the spirit does not have any advantage A further attempt to rid the skin of bacteria may then be made by chemical means The objection to such treatment repeated on the surgeon's hands does not have quite the same force for a single application to the patient, though it may be harmful The antiseptic used should be one which penetrates the superficial layers of the skin and has a persistent action, and these qualities are possessed by dyes and mercurial salts The former have the disadvantage of staining, though Tinker and Sutton s solution (5 per cent acriflavine in 50 per cent alcohol and 10 per cent acetone) is possibly less objectionable from this point of view than Bonney's blue paint (0 5 per cent brilliant green and 0 5 per cent crystal violet in 50 per cent. spirit) The best mercurial solution is Harrington's (mercury perchloride 0 8 gramme, hydrochloric acid 60 c cm methylated spirit 640 c cm, water 300 c cm), this may be coloured with chrysoidin Y (2 grammes per litre) if an indicator of the area covered by the application is desired

It may be asked whether such treatment as this should be carried out on the operating table or some time before operation Some authorities still suggest beginning it one or even two days beforehand Previous and repeated antiseptic treatment is only indicated when the skin is infected or devitalized, and even then it must be remembered that over-treatment is always harmful Antiseptic compresses, which make the skin sodden, are to be condemned If the principle of covering up all skin during all operations is observed the question of applying antiseptics becomes relatively unimportant

Of other current methods of skin treatment the following may be said The objections to iodine, so commonly used, are three the fact that certain skins are sensitive to it and will suffer blistering or peeling afterwards, the fact that it quickly disappears from the skin, being inactivated and destroyed by contact with blood, and its cost. It is said also that bowel which has been in *contact with iodine-painted skin is liable to form* adhesions Such contact should never be allowed to occur, for, though we have no proof of this effect, iodine is certainly an irritant which would cause exudative inflammation of the peritoneum Picric acid, another favourite application, irritates many skins, and occasionally produces such severe symptoms of poisoning as to cause the patient s death This section may conclude with a protest against the perfunctory dab which often precedes the insertion of a hypodermic needle If anything is worth doing at all it is worth doing properly, and if ether is used for sterilizing skin it should be rubbed on until the skin is really clean

Preventive Application of Antiseptics to Wounds

Is it or is it not possible chemically to destroy bacteria in a recent wound and so prevent sepsis? Some surgeons say "No, others "Yes,' and many have never seriously asked themselves this question Some will countenance the use of any of a large variety of antiseptics having quite different properties and suitabilities for such a purpose

This problem presents itself in a simple, clear, and urgent form when an accidental cut or prick occurs during

are of great practical value especially to laboratory workers the discovery of which depended upon delicate reasoning often hard for a reader unskilled in mathematical processes to understand

Mr Yule came to the conclusion that his book must be enlarged and that the aid of a younger collaborator was desirable To those of us to whom the *Introduction* is an old friend the risk seemed great But Mr Yule has been fortunate in his collaborator We have still practically the whole of our old companion and the new chapters (including one on interpolation and graduation by Mr Yule himself) conform to the original plan It is true that the demands made upon the sustained attention of a beginner by this eleventh edition are greater than those made by the first edition, but they are of the same kind If and when an important result or formula cannot be established by methods intelligible to a non-mathematician the fact is plainly stated and references given to sources I must not give a false impression The book is not now and never was, one to read while strap hanging in a tube train Probably most purely medical readers would be well advised to read first such a work as Dr Bradford Hill's little book (*Principles of Medical Statistics*) and to come to the *Introduction* with some general knowledge of why statistical methods are important in medical work Then if they are really interested in the subject and will take the trouble to work out some of the well chosen examples they are likely to make a life long friend

As I said at the beginning of this notice I am not an impartial judge Apart from this book Mr Yule's share in the development of medical statistical work under the enlightened patronage of the Medical Research Council and as a teacher at Cambridge has been so great that nobody intimately associated with that work can forget it but I am confident that nobody induced by what I have said to make a new literary acquaintance or renew an old one will be disappointed

M GREENWOOD

EVOLUTION OF TUBERCULOSIS IN MAN

Le Cycle de l'Infection Tuberculeuse Humaine By Jacques Brun Preface by Dr H Duffourt (Pp 372 25 illustrations 50 fr) Paris Masson et Cie 1936

Ranke's work on the evolution of tuberculosis in man has withstood the test of time There are well founded objections to his theory but its complete rejection by some workers has been based on too rigid an interpretation of his views Morbid anatomical studies and clinical observations have amply confirmed the justness of the general framework Ranke erred in his attempt to fit in his three stages with immunological conceptions and modes of transmission of the tubercle bacillus when the methods at our disposal for investigating the humoral factors in the disease were still grossly inadequate Nevertheless there is no other theory that will explain as satisfactorily the varied manifestations of tuberculosis in man It seems deplorable therefore that clinicians in England at all events should still consider Ranke's work as constituting pure theory detached from clinical practice

Those reading the book by Dr Jacques Brun will find it difficult to maintain this conservative attitude For he succeeds in showing the great help to be derived in clinical tuberculosis from a consideration that the disease evolves in three stages a primary period or period of invasion which follows the ante allergic interval a second period which includes the evolution of the primary lesions and the development of true post primary lesions in the lung and of lesions in the extrapulmonary organs and the tertiary stage or stage of isolated phthisis Each stage is fully described and discussed in regard to anatomical findings and clinical phenomena, immunological conceptions being kept somewhat in the background

While Dr Brun deserves our gratitude for presenting a difficult subject in an intelligible form and clear style it is necessary to point out his uncritical attitude in the first part of the book concerning generalities in human tuberculous infection for instance in his acceptance of the ultravirus On the other hand the second part which gives a critical survey of the various theories relating to the cycle of tuberculous infection, with special reference to that of Ranke is to be commended The book which is well produced and well illustrated, would be much improved by condensation of language and general presentation and by omission of repeated lavish acknowledgements which give the work the appearance of a 'these, and might cause the reader unjustifiably perhaps to attribute to the author an inadequate background of postgraduate experience

THE MENTAL STATE IN PARKINSONISM

L'État Mental des Parkinsoniens Contribution à son Étude Expérimentale By Witold Aubrun (Pp 156) Paris J B Baillière et Fils 1937

Dr Aubrun has undertaken a study of the mental state of twenty cases of Parkinsonism selected entirely in accordance with the exhibition of Parkinson's symptom complex irrespective of its cause only avoiding those of an advanced age whose condition is likely to be complicated by senility He found an absence or reduction of dreams which he regards as a result of the restriction of emotivity Intelligence is not markedly below the normal Early fatigue and a low level of efficiency in voluntary attention are characteristic Memory of concrete objects and of observations is good but logical memory and that for words and geometrical forms is bad The facility for association is practically non-existent To estimate this the free association test of Kent Rosanoff was employed In this the resulting word associations were few—only fourteen out of a standard fifty—and the rapidity of association was much reduced There is a lack of spontaneity in the associations and a tendency to perseveration

Experiments with Rorschach's test seem to show that these patients have marked perseveration However they can appreciate emotional situations in the environment but cannot exteriorize their own emotions Attention is good which bears out the observation that Parkinsonians are subvigilant but supertenacious They tend to dwell too much on a detail and therefore miss the significance of the whole Their kinaesthetic associations are very deficient and there is a general impoverishment of the sources of fantasy

The intellectual processes remain intact but the slowness of association and of the current of thought makes them appear poor Certain psychomotor tests were carried out which showed (1) an increase of at least 60 per cent in simple reaction time There was fair regularity in the performance of these tests and there was no sign of special proneness to fatigue The actual motor disability did not seem to be the cause of this delay in most cases (2) Motor or kinaesthetic memory is altered in 50 per cent of the cases but in a somewhat irregular way which is difficult to explain (3) Tenacity is lessened and in this test fatigue seems to appear early but in rather an irregular way which is also difficult to explain and this is not

aseptic operation. Here is a small wound which is known to contain dangerous bacteria. They are in the cavity of the wound, and have not yet invaded the surrounding tissues. Can they be destroyed, and if so, how? This question has been answered by abundant experiments in which both incised and punctured wounds in mice have been infected with virulent streptococci and treated by the subsequent application or injection of antiseptic solutions. Such substances as phenol and mercury perchloride are powerless to prevent the spread of infection, but compounds of the diamino acridine series will regularly achieve this. They owe this power to an enormous capacity for restraining the growth of *Streptococcus pyogenes* effective in dilutions of 1 in 100,000 or even higher, and to the fact that this capacity is unimpaired by the presence of serum or blood. They are also comparatively non-toxic: leucocytes retain their motility in a 1 in 1,000 solution of acriflavine in spite of being deeply stained by it. No other class of antiseptic has these properties or even approaches them. The indications in these circumstances are therefore clear. A dressing saturated in 0·2 per cent. acriflavine should be applied to the superficial scratch or cut and retained for two hours. A punctured wound is treated by introducing a hypodermic needle and injecting the solution under pressure. Some degree of permeation of the surrounding tissues is desirable, and this may be achieved by deliberately infiltrating them by subcutaneous injection.

Similar treatment may logically be applied to a recent and possibly infected wound of any kind: thorough irrigation or actual immersion ensuring that the solution reaches all parts of it. Although this is the ideal treatment, the trouble and expense involved may be considered excessive for ordinary minor casualties, and the general run of accidental wounds may be cleaned and disinfected together by a solution of one of the more efficient and less toxic antiseptics of coal-tar origin. Suitable preparations and strengths are dettol (5 per cent.), izal (0·5 per cent.), and cyllin (0·5 per cent.).

About other antiseptics commonly employed in these circumstances the following facts should be known. Phenol and lysol are highly destructive to tissue in concentrations adequate for antiseptic action, and weaker solutions are ineffective. Iodine is inactivated by blood. Mercury salts are exceedingly slow in action and form inactive compounds with serum proteins. Brilliant green is more actively bactericidal in a short period than acriflavine but also considerably more toxic, although not actually irritant or caustic. All antiseptics which act by liberating chlorine or oxygen are inactivated in the presence of blood or serum, the patient and persistent use of the former application being renewed until all visible bleeding has ceased, should however contribute to the disinfection of a wound.

We wish it to be understood that we are not concerned in this article with surgical procedures other than the use of antiseptics. Excision is of course the most efficient means of removing infection from a recent wound when circumstances permit.

Antiseptic Treatment of Established Infections

A serious comparison of the depths to which various antiseptics can penetrate tissue and the depth to which bacterial invasion proceeds in different types of infection has never been made. It may safely be assumed however, that bacteria which have once invaded the tissues become relatively inaccessible to antiseptic applications, and these can have only a superficial effect strikingly beneficial in but a few special cases outside our present survey. Nevertheless the antiseptic treatment of an infected wound may have its advantages in cleansing and deodorizing, in promoting fluid exudation by mild irritant action, and what is most important in preventing the access of further infection. These objects can all be secured by the familiar method of continuous irrigation with Dakin's solution. We are not concerned to press strongly the claims of this or any other method of treatment. Whatever is done, strong antiseptic applications to the wound itself are to be avoided since they hinder phagocytosis and the growth of reparative tissue. It is exceedingly doubtful whether such application as silver nitrate solutions are ever beneficial since what may be gained in bactericidal effect is counterbalanced by tissue necrosis producing a pabulum for further bacterial growth. It is most noteworthy in connexion with wound treatment that not all bacteria are equally susceptible to the action of the same antiseptic. Streptococci and staphylococci are many times more susceptible, as measured in terms of effective dilution, than are some Gram-negative bacilli to the action of acriflavine. *B. proteus* and *B. pyocyaneus* are highly resistant to this and to many other antiseptics. For the treatment of wounds as opposed to their preventive disinfection acriflavine and other dyes have the disadvantage of being absorbed by the material of dressings so that they will only be active in the presence of a large excess of the solution. Their possible action is still further hindered by intimate admixture with an oily basis as in the acriflavine emulsion of the *B.P.C.* and this elaborate preparation has no demonstrable antiseptic action whatever. A similar objection applies to the use of bipp, and we have already implied that in our opinion the claims of iodoform to be regarded as an efficient antiseptic rest on a very insecure basis.

In addition to the treatment of infected wounds antiseptic irrigation usually plays a prominent part in treating infections of the conjunctiva, the upper air passages, the urethra, and other portions of the urinary tract, and the vagina, while antiseptics are also extensively employed for affections of the skin. With these specialized uses it is not our purpose to deal, but it may be pointed out that similar principles apply to them. There is the same necessity to guard against doing damage which outweighs the benefit conferred, and the same unlikelihood of reaching bacteria other than those in surface exudates. The conjunctiva affords a striking example of the fact that prevention by antiseptics is much more certain than cure. Crede's method prevents ophthalmia neonatorum because it attacks the gonococcus before the tissues have been invaded, and it would probably succeed equally well if some other and less irritating antiseptic than silver nitrate were used.

Deep Antisepsis

Hitherto we have considered chiefly those methods of employing antiseptics which involve application to a surface. It must not be forgotten that attempts of many kinds are made by chemical means to destroy bacteria more deeply situated, attempts which consist in administering the antiseptic either by the mouth or by some form of injection. The most ambitious of these aim at disinfection of the blood in septicæmia; others at disinfecting the urinary, intestinal, or biliary tracts.

Circulatory Antiseptics.—It is beyond question that *p*-aminobenzenesulphonamide (sulphanilamide), which is derived from, and has superseded the original prontosil,

in accordance with the results of other tests (4) Designs traced from the mirror image were performed reasonably well by some but in others produced an emotional inhibition or block Responses to emotional shock were tested by various methods—namely, pulse rate, psychogalvanic reflex, and blood changes These showed feebleness and a shortened duration or even an absence of the normal reactions In the opinion of the author it is this failure in the elementary emotional processes which is responsible for the psychological abnormalities of the Parkinsonian

This book is of value in that it puts on an experimental basis many presumptions which no doubt have been made before in connexion with the mental make-up of the Parkinsonian The conclusion that it is the emotional lack which is fundamental is interesting in relation to the location of the lesions, especially in the basal ganglia, though it is of course recognized that the cortex shares to some extent in the pathological changes

GENERAL BACTERIOLOGY

Bacteriology A Textbook of Microorganisms By Fred Wilbur Tanner Third edition (Pp 510 151 figures 17s 6d net) New York John Wiley and Sons Ltd London Chapman and Hall Ltd 1937

There is a good deal in the contention that the study of purely medical bacteriology may give a distorted impression of microbiology as a whole The wider scope and broader outlook of Professor F W Tanner's book are exceptional in a work of this size, and those students who are able to undertake a comprehensive study of the subject will find this book a good introduction to it The average medical student has no such opportunity, and for him the book will unfortunately have a limited appeal Anyone not previously acquainted with it might be deceived by the title, it is not a textbook on ordinary lines, contains little about technique—a subject dealt with in a companion volume by the author—and little description of individual species, indeed, the only purely descriptive chapters are two on fungi and one, perhaps unduly brief, on protozoa The remainder of the book deals largely with bacterial physiology, and the subjects receiving fullest treatment are bacterial metabolism and the phenomena of chemical disinfection On the applied side there are chapters on the bacteriology of air, water, sewage, milk and other foods, and on industrial methods of fermentation, and finally on the underlying processes of infective disease considered in very general terms So wide a range of subjects can naturally not all be treated fully, and here and there condensation or omission, together with a tendency to inexactitude of statement, appears likely to create false impressions in an uninstructed mind. The more advanced student of microbiology who may take this book up with the object of viewing his subject from a new standpoint will find stimulating reading in it

COMPARATIVE ANATOMY

Laboratory Studies in Comparative Anatomy By W C Senning, Ph.D (Pp 188 15 figures 10s 6d) London McGraw Hill Publishing Co Ltd 1937

Outline Drawings for Laboratory Studies in Comparative Anatomy By W C Senning Ph D (72 drawings 8s 6d) London McGraw-Hill Publishing Co Ltd 1937

Laboratory Studies in Comparative Anatomy with *Outline Drawings* by Dr W C Senning of Cornell University, should prove of great help to the systematic study of practical zoology From the standpoint of morphology the sketches form a well thought-out course which if carefully followed should serve as a sound preparation for independent research work The author has successfully carried out the idea which he expresses—namely, that the methodical study of a few typical forms of animal, chosen with reference to their phylogenetic importance, will be of much greater value than a superficial examination of a large number of types The *Laboratory Studies* which are obviously the outcome of years of teaching experience, will, we believe, serve as a pattern for teachers as well as for the taught The *Outline Drawings* set a high standard of accuracy, and their use should be invaluable in providing a clear mental picture of the objects studied, in this way assisting the student to follow the more detailed descriptions of the textbooks, and giving a permanent visual impression of the standard types Frequent mention is made of "demonstration preparations"—and incidentally this draws attention to the value of these as an aid to the dissection and study of specimens being examined in the laboratory, and of the importance of preparing representative specimens for teaching purposes Other points that deserve favourable mention are the short definitions of zoological terms, and the questions inserted in the descriptions of the work which are left to be answered by personal observation of the object being studied We can thoroughly recommend the *Outlines* as a mental training comparable to that of the classics or mathematics but of a different order, involving the training of the eyes and hands in the accomplishment of accurate work, and also as an introduction to the scientific outlook on important problems of general biological interest

Notes on Books

A second edition has now been published of the *Surgery of the Sympathetic Nervous System* by Professors GEORGE E GASK and J PATERSON ROSS (Baillière, Tindall and Cox, 16s) The first was reviewed at some length in our issue of April 14, 1934, when we said that this comprehensive book was a notable contribution to surgical literature Further experience in this branch of surgery has enabled the authors to form opinions sufficiently well supported to warrant their inclusion, and these additions form the chief variation from the original text The most important new chapters are the sections on clinical grading and prognosis of Raynaud's disease, on recognition of localized structural disease of the main arteries, on afferent pathways in the sympathetic system, and on sympathectomy for dysphagia The authors present opinion is that the late result of sympathectomy depends mostly upon the nature of the disease, and not, as we had previously supposed, upon the powers of the sympathetic to regenerate, and of the organs to function independently of their nerve supply The effect of sympathetic section should therefore be known within six months of the operation, for the subsequent history of the case will depend upon whether the pathological process in the denervated organs is stationary or progressive"

Dr Bodo Otto was born in Hanover in 1711 and died at Reading in the newly constituted United States of America in 1787 His father was forester on the estate of Baron Bodo von Oberg, after whom he was christened Bodo He was apprenticed to more than one surgeon in the usual course, and was admitted to examination, after twelve years' pupilage, by the authorities at Luneberg, and was found qualified to practise He soon migrated to America and practised in Philadelphia, Baltimore, and Reading, serving as a surgeon throughout the war against England Round his life Mr JAMES E GIBSON has woven the story of the American Revolution in so far as the medical side was involved He has gone to original sources for his

administered in adequate doses by the mouth, is capable of destroying haemolytic streptococci in the blood stream This astonishing action, fully attested by both laboratory experiment and clinical experience, stands in strong contrast to that of every reagent previously employed for this purpose The folly and futility of injecting intravenously such reagents as eusol and mercury salts are now generally recognized Mercurochrome had a vogue for this purpose, in spite of the repeated demonstration that pyogenic cocci would actually grow in blood containing this drug in a concentration hundreds of times greater than can be attained therapeutically in the circulation Other, and otherwise more efficient, mercury compounds are useless for this purpose A few dyes might be expected to exert some effect, but they are probably eliminated too rapidly to attain it one clue to the success of sulphanilamide is that it remains in maximal concentration in the blood for six hours It is to be hoped that the discovery of this drug will banish all substances previously used as circulatory antiseptics into the limbo of forgotten things

Urinary Antiseptics—Here again the advent first of mandelic acid and then of sulphanilamide has largely superseded previous treatments of doubtful efficiency Two other antiseptics have a demonstrable action in the urinary tract hexamine, which is dependent, like mandelic acid, on the maintenance of a low *p*H, and hexylresorcinol, the behaviour of which is unaccountably erratic

Intestinal Antiseptics—The coal-tar preparations which are sometimes given to colostomy patients and in various other circumstances in order to suppress bacterial activity in the lower bowel do not reduce the bacterial population of the colon, and have indeed never been shown to reach it So far as we are aware an antiseptic that is neither absorbed from the bowel nor rendered inert by chemical combination with its contents has yet to be found

Biliary Antiseptics—We are not aware of a convincing demonstration that any drug acts as a biliary antiseptic Hexamine has been much lauded for this purpose, this substance is not itself bactericidal at all, and acts only by liberating formaldehyde under the influence of acid A degree of acidity adequate for this effect exists nowhere in the body except in the stomach and the urinary tract For the same reason hexamine is quite inert in the central nervous system

Conclusion

It has been possible in the present review to deal only with better-known antiseptics and their commoner and more important uses Essential oils, boric and other acids, soaps, metals, and even the excrement of maggots have been used for their antiseptic properties For each of the proprietary antiseptics of coal-tar origin which we have named there are a dozen others, similar in composition but in some cases less familiar and unsupported by the same variety of testimony to their value Since no authority in this country has undertaken the task of examining and adjudicating upon preparations of this kind the medical profession in general has no means other than clinical trial of knowing what their merits are In this as in other directions which we have indicated the intelligent use of antiseptics is rendered difficult by lack of information Order is more likely to be brought into the present chaos of this subject if it is more often approached in the manner we have attempted here—that of inquiring into the evidence that the properties of an antiseptic are suited to a particular task

NATIONAL FITNESS AND THE CARE OF THE INSANE

BY

SIR ROBERT ARMSTRONG-JONES, M D, D Sc., F R C P

A striking demonstration of physical exercises combined with musical rhythm was recently given by the Margaret Morris Society before an audience of teachers nurses, representatives of the Eugenics Society, and medical men, some of the last named associated with the care and treatment of the insane and coming from a distance so far from London as Cumberland This most interesting exposition of the value of graded muscular movements, lasting nearly two hours, was presented on December 1 at 31 Cromwell Road, S W 7, the London institute of the movement It was fully explained by Miss Margaret Morris and her staff who had already directed their remedial treatment classes in several mental hospitals and private homes for the care and treatment of the insane The attractive demonstration included the use of general and special muscular movements, easy of execution and pleasing to watch by which to secure the balance of the body, graceful postures, and mental relaxation They taught the performance of physiological muscular contractions, which were carried out without effort, and a normal poise was maintained which is deplorably wanting in all mental cases Recently the advocacy of physical fitness has been taken up with great earnestness by the Government in pressing forward the scheme for national fitness Local authorities on the one hand and a great array of voluntary workers on the other have been engaged in rousing public interest in activities for an improvement in the mental and physical condition of the people, but in no section is this more necessary than in the population of our mental hospitals

Members of Parliament who desire to urge primarily the question of nutrition—free food and milk—need have no anxiety to-day about the food provided in the mental hospitals for in these the dietary has been fully considered by the responsible local authorities During the last twenty years the maintenance rate in the public mental hospitals has been more than doubled, and the nutrition of those under treatment appears to be satisfactory, but the general improvement in bodily conditions through the judicious use of muscular exercise and movements has perhaps not received the special attention required as an aid in remedial treatment It is not yet realized that the Lunacy Act, 1930, makes it possible to receive into mental hospitals cases in their early stages voluntarily—that is, without the doctor's certificate of insanity Naturally it is obligatory upon those responsible for the treatment—apart from the question of public duty, personal responsibility, or humanity—to do their very best towards the patient's rehabilitation and recovery

The Numbers of Mental Patients

The question is a very big one, for in the year 1936—the last for which we have any record—there were under care in our mental hospitals over 130,000 persons suffering from mental disease Of these more than 25,000 were new cases, a fourth of them—upwards of 6,000—being voluntary patients Also of the 82,000 cases of mental deficiency 4,000 were new cases admitted during 1936 (although none of these was a voluntary case) Every effort should be (and is) made for their mental improvement and restoration—quite apart from the urge arising out of a fellow feeling and sympathy, which their condition entitles them to receive

It is not criticism of the past we require but suggestions for the future we should begin therefore, by asking 'What sort of cases are likely to improve by physical treatment?'—that is, by muscular movements, bodily

information and the results are as valuable as they were previously unknown Envy malice and hatred were rampant The quarrels of Rush Morgan and Shippen are described in detail, as well as the appalling condition of the colonial troops who seem to have suffered more from epidemics of small-pox than from the ordinary diseases of camp life The book is illustrated with some excellent reproductions of the portraits of the chief actors and concludes with extracts from the journal of the Rev Dr James Sproat, chaplain to the hospitals It appears from these extracts that he was worthy to be classed with John and Charles Wesley, his contemporaries in England In *Dr Bodo Otto and the Medical Background of the American Revolution* (Baillière, Tindall and Cox, 18s) Mr Gibson has done a valuable piece of work for which we are grateful He might have added a portrait of Haym Salomon who deserved so well of his fellow countrymen but has never received adequate recognition

At first glance some two hundred and fifty pages seems a large allowance for the subject of *Everyday First Aid* (D Appleton Century Co., 6s), but Dr WALTER F COBB of New York handles the question in such an original and ingenious way that the book is by no means too long Each chapter begins with an appropriate newspaper extract, following such headlines as Enraged Bull Chases Hikers' 'Despondent Girl Attempts Suicide Takes Poison Now Wants to Live Test-Tube Explodes in 'Chem Laboratory Sprays Acid in Student's Eyes Dr Cobb then discusses and analyses each situation, concisely summarizes the appropriate first aid treatment, and concludes the chapter with the subsequent history of the case and a short commentary There is a good index and also an appendix with lists of first aid equipment for the home, for the automobile, and for personal use The illustrations are of the dramatic poster type popular in American propaganda. Dr Cobb's first aid methods are perhaps not sufficiently stereotyped to satisfy the regulations of the St John Ambulance Brigade but they are practical and efficient First aid students should enjoy this book

The House of Curious is the somewhat irrelevant title chosen by Dr A C ALPORT for the pre war portion of his autobiography (Hutchinson 10s 6d) The book describes the writer's boyhood in South Africa his student days in Edinburgh, and his experiences in general practice in Johannesburg In the first decade of the present century life moved swiftly on the Rand The lure of the city of gold attracted an amazing medley of queer types disorders were frequent and the routine of medical practice was often broken by exciting events On one occasion Dr Alport was chased from an asylum ward by a vengeful maniac with a carving knife on another when Chinese labour troubles had created widespread alarm a nervous householder greeted him by firing a revolver through the front door Such happenings were all in the day's work The author's adventurous disposition naturally induced him to tempt fortune in mining ventures and on the turf but he was both more scrupulous and less lucky than many of those who achieved an easy road to wealth But Dr Alport never repines A balanced philosophy of life and a sense of humour sustain him equally in failure and success Although most of this book is devoted to South Africa there is also an interesting and entertaining description of student days in Edinburgh where the author occupied lodgings crammed with stuffed cats He draws excellent pen portraits of several of the professors Dr Alport's style is breezy and completely free from affectation and there is not a dull page in the book

Many books on old age and the means of prolonging life have been written most of them by those who have already passed the threescore years and ten of the psalmist A notable example of such veteran authorship was the late Dr A GUEBHARD the Parisian obstetrician president of the Académie de Médecine in 1906 In his ninety ninth year he wrote a small book *Pour vivre cent ans ou L'Art de prolonger ses jours* and on November 8, 1932, was congratulated on his centenary at a special meeting of the Académie de Médecine in Paris The original brochure was reviewed in our columns (1931, 1, 455) and an account of the reception at the Académie de Médecine was contributed to the issue of September 18, 1932 Dr J E H Gatt of Malta translated the would be centenarians guide into English with a dedication to Lord Strickland on the occasion of his seventy third birthday

Dr ROSALIE SLAUGHTER MORTON belongs to the second generation of medical women The first left some sort of a path but much hard clearing work had to be done before the medical career could become a highroad along which any woman of average ability and energy could travel In her autobiography (*A Woman Surgeon* London Robert Hale and Company 12s 6d) Mrs Morton sets out to tell the story of how she made a career for herself and helped to break down obstacles for her successors In doing so she purposely draws a picture of the kind of woman who did what she has done She therefore holds up to legitimate criticism not only her achievements but also her temperament and attitude as seen by herself Her professional record is very varied and she has gained considerable distinction, particularly in the Balkans where she was awarded from time to time six decorations Her merits however, were also recognized by decorations from France and America She gives a list of them at the beginning of the book She studied in Germany and Paris, travelled through Scandinavia and Russia to India saw some of the work of the Labrador settlements and was instrumental in founding the American Women's Hospitals which have done splendid work in the Eastern Mediterranean and in Western Asia She also founded the International Serbian Educational Committee, and brought a large party of young Serbians to America to educate them and train them for careers Her account of her personal outlook is much less attractive She obviously has tremendous drive and ability but her story is defaced on every page by evidence of complacency and of the triumphant retention into middle life of a stereotyped emotional attitude It is fair to say of this book that if it had been announced as the work of Mr Sinclair Lewis or Mr H E Mencken it would have been acclaimed as a miracle of satire

We sympathize with Dr NATHAN RAW'S enthusiasm in desiring the eradication of human tuberculosis of bovine origin and his little book *Bovine Tuberculosis in Man* (Baillière Tindall and Cox 6s) has much to commend it in its insistence on the measures to adopt particularly universal pasteurization of milk and in the meantime boiling of the milk at home before consumption But it is greatly to be regretted that as a vehicle for this laudible propaganda a volume should have been written which pushes forward a theory—the mutation of the bovine bacillus in the human body—that has not a scrip of scientific backing—indeed Dr Raw himself keeps pointing this out—and contains many statements that contradict all scientific evidence The book also describes Dr Raw's method of immunizing cattle with a non virulent culture of the tubercle bacillus but no results are given except the general statement that the results have been most encouraging The constant repetition of the same matter in chapter after chapter suggests that the book may represent a collection of essays or addresses

A new edition has now been published at 6d by the British Museum (Natural History) of the valuable pamphlet *The Bed Bug, Its Habits and Life History and How to Deal with It* by Mr A W MCKENNY HUGHES It forms No 5 of the Economic Series

In his booklet *Weeds Weeds Weeds* Sir CHARLES BOYS F.R.S describes and classifies weeds common in and around gardens and lawns and gives information as to the best means of destroying them It is published by Wightman and Co at 1s

training physical exercise rhythmic drills and mild athletics My answer is All young persons including nearly 7 000 cases under 16 detained as mentally defective in institutions, but it is not for these alone that this treatment appears to be applicable There are one regrets to know, thousands of young persons in our mental hospitals under care and control as mentally diseased and unsound who were once in full possession of their mental faculties but who have succumbed under the stress and strain of civilization

The Value of Muscular Movements in Mental Disorder

It is for this body of mentally ill people that I venture to think muscular movements under skilled direction would provide remedial treatment The question as to the great value of muscular movements for functional mental disorder has always been answered in the affirmative We know too well the relation between the mind and the body We see the effect of delirium of high temperatures of the toxin of fevers of drugs of alcohol and of narcotics upon the mind and also we know the effect of the mind upon the body—how bad news reacts on the body and how mental shocks affect digestion sleep and bodily movements We know how from their earliest days healthy children depend upon proper outlets of muscular activity for their growth and development as well as happiness We have only to watch the folk dances in rural districts at home and abroad to see the joy which young and old experience when suitably dressed, in performing the stately pavan the minuet the gavotte, and appropriate folk dances

The properly organized nursery of to day contains many objects used in games to encourage the instinct of movement such as running jumping marching singing kicking and gesticulating and the backward child can often be roused by an interest in handling following marching or walking with rhythm not to mention seeing and hearing In mental breakdown affection and disease the most common even universal mental symptom is failure to fix the attention to discriminate and to remember things In order to secure that interest we must endeavour to kindle an activity and try to adapt this for useful purposes such as handicraft weaving knitting artificial flower making mat making tailoring shoe making for indoor exercise and gardening looking after animals (rabbits dogs and poultry) for outdoor work

Effects of Muscular Exercise

It is acknowledged by all physiologists doctors and teachers that *muscular exercise*

1 Increases the work of the lungs augmenting breathing action letting in more oxygen and getting rid of carbon dioxide

2. Quickens the heart and circulation making elimination more effective through the lungs and skin

3 Raises the body heat by increased tissue changes—metabolism

4 Withdraws blood from the brain and sends more to the muscles thus exercise favours healthy action

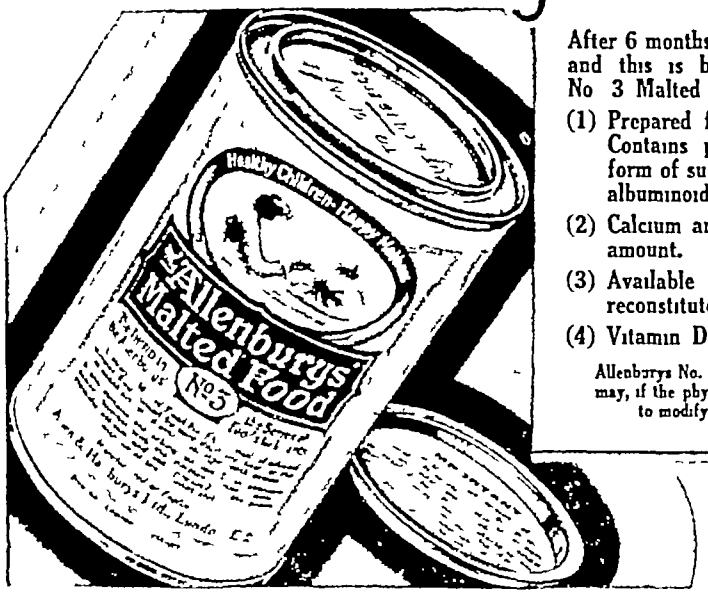
5 Provides a healthy change which gives pleasure the mind being soothed and calmed and also invigorated

6 Interests the child who remembers the exercises and enjoys the pleasure Associative memory is rekindled

There are five senses (and indeed many more) which are avenues to the human mind but muscular feelings are the first and most fundamental of the constituents The muscular sense precedes all the other senses Muscular contractions are an essential element of the will and as these are pleasurable they tend to reawaken resolution and decision and to strengthen the will power Muscular efforts most often cease in illness or after fatigue and the limpness of an ill child is in marked contrast to the activity of a healthy one If health is to be preserved the vigour and nutrition of the muscular system must be exercised, practised and maintained The experience of Dr Elizabeth Casson medical director of Dorset House School of Occupational Therapy confirmed mine when I was the physician in care of mentally lowered children at Earlswood, and her good work is appraised as also is the Margaret Morris Movement on page 76 of the Board of Control report for 1936 just issued

I think this movement should provide one of the most successful remedial treatments in securing the control of the attention and in mental restoration It helps the power and grasp of the mind by practice in obeying commands It strengthens the will It excites curiosity imitation interest and memory which in cases of mental derangement are the fundamental elements in the re kindling and rousing of intelligence It was warmly supported by Dr Stella Churchill I need only add that this work receives the full approval of the National Advisory Council on Physical Training as well as of the Amateur Athletic Association and many local authorities

I have presumed to pen these notes in order to emphasize the value of properly graded muscular exercises as a help in the remedial care and treatment of mental cases—young and old



Nova et Vetera

THE MEDICAL LIFE OF BOSSUET

Dr L Brodier the distinguished president of the French Society of the History of Medicine contributes to a recent issue of its *Bulletin*[1] an article on the medical life of the eloquent preacher known as the Eagle of Meaux Jacques Bénigne Bossuet was born at Dijon on September 27 1627 the seventh child of a family of nine He appears to have been free from disease until the age of 49 when he began to suffer from attacks of malaria which recurred during the next three years but were cured by cinchona then known by the name of Jesuits powder For the next twenty years he enjoyed perfect health and then at the age of 72 contracted eczema which lasted for more than two months and was attributed by his doctors to fasting during Lent The following year he developed symptoms of cholecystitis Fagon the celebrated physician to Louis XIV prescribed bleeding—which was performed by Dionis senior surgeon to the Duchess of Burgundy—daily enemata and a diet of soup and eggs From this time until his death Bossuet became subject to attacks of diarrhoea sometimes accompanied by bilious vomiting and constipation which necessitated numerous purgatives In 1701 at the age of 74 Bossuet first noticed that his urine was tinged with blood though he had no pain in the lumbar region or bladder His regular medical attendant Denis Dodart physician to the Princesse de Conti and her children recommended a season at Forges les Eaux a spa much in vogue for the treatment of stone and urinary diseases but this suggestion did not meet with Fagon's approval and was not carried out The diagnosis of stone in the bladder made by Dodart was confirmed by the expulsion of a small calculus and an infusion of tea, which had recently been introduced into France and was reported to prevent the formation of vesical calculi was ordered to be taken every morning During the next two years and eight months, ending with his death at the age of 76, Bossuet suffered from acute and subacute attacks of calculus cystitis An operation to be performed by the celebrated lithotomist Georges Marechal was discussed but decided against The necropsy showed calcification of the gall bladder hydrocele and a stone almost as large as an egg in the bladder which was ulcerated and gangrenous

The Weaning Period —

After 6 months the child can deal with starch, and this is best introduced as Allenburys No 3 Malted Food.

(1) Prepared from roasted wheat and malt. Contains partly converted starch in the form of sugars and dextrins, together with albuminoid constituents of wheat.

(2) Calcium and phosphorus present in ample amount.

(3) Available iron 4 parts per 1,000,000 reconstituted.

(4) Vitamin D +++

Allenburys No. 3 Food makes a thickened food and may, if the physician favours this method, be used to modify cow's milk in earlier infancy

Descriptive literature and clinical sample will be sent on application

ALLEN & HANBURYS LTD LONDON, E.2

Telephone
Bishopsgate 3401 (12 lines)

RADIUM POLICY AND PRACTICE

THE 1937 REPORT

The eighth annual report of the National Radium Trust and Radium Commission[1] is of unusual interest, as it foreshadows extensive and important developments of their activities in the near future

Treatment of cancer by massive radium units, which has hitherto been more or less on probation, has given results which warrant its adoption as a recognized therapeutic procedure The radium content of each unit varies from 1 to 5 grammes or more, so that the adoption of beam therapy by a number of centres necessitates large additions to the amount of radium at the Commission's disposal At the same time it is recognized that if this method of treatment is beneficial any delay in meeting demands for the installation of suitable units is unjustifiable Negotiations were accordingly entered into with the Union Minière du Haut Katanga and the Eldorado Gold Mines of Canada with a view to securing the necessary supplies on the most favourable terms It was decided to accept the offer made by the Canadian firm, by which ten grammes of radium were loaned to the Trust with the option of purchase within two years If it were eventually decided not to purchase, the radium was to be returned to the company and the Trust to pay a rental of 5 per cent per annum on the capital value of the radium and containers Much of the radium so obtained has already been allotted to various centres by the Commission

These allotments had scarcely been made when the Commission reported that several centres could make use of further quantities of radium for beam therapy, and it was suggested that a further 10 grammes should be borrowed from the Eldorado Company, the question of adopting this proposal is still under consideration

A Time for Co-ordinated Attack

It is evident that if the Trust and Commission are to continue their work effectively large additions to their financial resources are imperative and will almost undoubtedly involve an appeal to the Government In this connexion the report states that

> The Commission believes that there has never been a more favourable time for an open and co ordinated attack upon cancer, and is confident that such an attack under the aegis of the Government would obtain immediate support from the laity, from the hospitals both voluntary and statutory and from universities and colleges of surgeons and physicians

It might have been added that such an attack would have the cordial and whole-hearted support of the medical profession generally, and it is indeed only by its support and assistance that the laity can be induced to realize the widespread benefits which would result from such concerted and systematic action The Radium Commission is not only responsible for the allotment of the radium under its control, but acting in collaboration with other bodies takes the necessary steps to ensure its most efficient and economical use The names and professional standing of the Commissioners are sufficient guarantee for the thorough and impartial execution of its important and often very difficult duties It is indeed a most fortunate thing for the profession and for the public generally that by far the largest amount of radium in this country is in the hands of such a body as the Radium Commission, and is placed at a limited number of centres where there is every guarantee that it will be most advantageously and safely used

The British Centres

There are now twenty-three such centres in England, Scotland and Wales, of which thirteen are national centres, nine are regional centres, and one is a 'recognized hospital' The term 'national centre" is reserved for teaching hospitals to which radium is loaned by the Commission. Glasgow has now not only two national centres but also a "recognized hospital" —that is, a hospital at which the radium department is recognized by the Commission as carrying on work at a high standard of efficiency but having no radium on loan from the Commission. Two additional regional centres, at Bradford and Leicester, have been formed during the past year

The concentration of radium treatment at a number of centres is one of the main objects of the Commission's policy Small hospitals cannot run efficient radiotherapeutic clinics, and the only hope for efficient service is that they should be linked up together so as to make one radiotherapeutic centre between several Such a policy is necessary in order to give the amount of radium which will ensure their having all the different kinds of containers which are necessary for efficient radium therapy, and to provide the necessary x ray apparatus to ensure that all the cases can be continuously treated without keeping an expensive apparatus idle It is further necessary that those concerned in the work have sufficient experience of the diseases they are treating and the methods of treatment they are using, and also to ensure that there are enough cases to provide a "follow up, which is the only check on satisfactory treatment

An Ambitious Programme

The general views of the Commission on this matter cannot be better expressed than in the following passage from the present report

> The view of the Commission is that an efficient treatment centre should have accommodation for not less than 300 beds and an efficient pathological service, accessibility of consultants in all departments be of such a size as to permit the treatment of at least 400 new cancer patients every year keep fully occupied at least 1 gramme of radium, possess an efficient deep x ray therapy apparatus and employ at least one whole-time radiotherapist and a physicist At a limited number of centres—which might form training centres—there should also be available a radium mass unit of from 3 to 5 grammes There should be adequate clerical assistance to form an efficient follow up department '

The programme is undoubtedly an ambitious one, and the Commission fully realizes that it is not likely to be

[1] Eighth Annual Report of the National Radium Trust and the Radium Commission 1936–7 Including a Statistical Report London H M Stationery Office Cmd 5612. (1s 3d)

a combined test meal with alcohol and histamine. Histamine gave the humeral—or perhaps better called the pharmacological—type of stimulus It gave an acid secretion when other test meals failed It was independent of psychic factors, added nothing to the stomach, and the pure juice unneutralized by any food material was obtained Alcohol was likewise an excellent stimulus to gastric secretion giving an ideal juice for analysis From the standpoint of the laboratory worker the small volume of alcohol did not lead to any dilution of the juice, did not neutralize any of it, and there was a sharp rise in acidity, usually without any preliminary drop such as was found with the ordinary type of test meal The alcohol was given first and the histamine afterwards Alcohol was objected to by some people as not constituting a physiological response The nature of a physiological response was arguable, but if it had anything to do with palatability he thought most people would agree that alcohol was superior to the masses of oatmeal such as could only be approved by a Scottish Nationalist!

Dr P E T HANCOCK showed a number of slides illustrating cases of cancer seen gastroscopically They were cases from the Royal Cancer Hospital under the care of Mr C A. Joll

Sir JAMES WALTON said how gratifying it was to see these newer methods of investigation being worked out by the younger men He believed that *x*-ray investigation for ulcer or carcinoma was proved accurate in from 90 to 95 per cent of cases, but in some the *x* ray method was difficult Dr G E VILVANDRÉ as one who had carried out many *x* ray examinations, hoped that the workers with gastroscopy would go ahead, because he felt that by *x* rays alone a case of early carcinoma might be missed, even with Berg's method Dr G W GOODHART was critical of the use of alcohol in what was supposed to be a meal for testing physiological function

Local News

ENGLAND AND WALES

Rehabilitation Committee Modern Fracture Clinics

The Interdepartmental Committee which has been appointed by the Home Secretary, Minister of Health, and Secretary of State for Scotland to inquire into the arrangements for restoration of the working capacity of persons injured by accidents heard evidence on December 17 from Sir Cuthbert Wallace, President, Professor Grey Turner, Vice-President, of the Royal College of Surgeons of England, and Professor Barling a member of the Council of the College, in support of the organization of fracture clinics on lines which the committee has recommended in its interim report issued earlier this year (see *British Medical Journal* June 12, 1937, p 1218) The witnesses discussed the medical staffing of the clinics the steps which should be taken to instruct medical men in the modern methods of treating fractures, and the part which general practitioners might take in an organized fracture service

King's Fund Distribution

The Duke of Kent in his presidential address at the council meeting of King Edward's Hospital Fund for London at St James's Palace on December 13 announced cash grants to the voluntary hospitals of London of £300 000 The cheques will be received by the hospitals this week Of the total amount distributed about £30 000 goes to schemes of capital expenditure and the remainder to maintenance Grants on this scale have been made ever since the slump and the King's Fund has for three years been deliberately living beyond its income in order to give hospitals extra help during a difficult period The Duke, referring to this, said I trust that the importance of this will be recognized by the public and that the deficit will soon be met by an increase in our income ' The success of the three combined flag days, which realized £7,000 more than the seventy seven flag days in 1935, was mentioned as one of the important events of the year Another aspect of public support was the growth of the Hospital Saving Association, whose income from contributions now exceeds £1 000 000 Speaking further of the spirit of co-operation which exists among the voluntary hospitals, His Royal Highness referred to the valuable work of the London Voluntary Hospitals Committee, which keeps the voluntary and municipal hospitals of London in contact with each other "The King's Fund helped to found it,' he said, "and it keeps in close touch with the Fund It is the representative body for the discussion of all matters affecting the voluntary hospitals, and it also consults on their behalf with the London County Council '

M O H for the City

The City Corporation has appointed Dr Charles F White to be medical officer of health for the City of London at a salary of £2,000 a year Dr White has been medical officer of health of the Port of London since 1928, and before then held in succession the appointments of assistant M O.H. for the Port of Liverpool and medical officer in the Ministry of Health Since the death of Dr W M Willoughby in November 1936, Dr White has been acting as M O.H of the City, and pending the appointment of a successor as M O.H of the Port he will continue to carry on the duties of that post also

SCOTLAND

New Chancellor of Edinburgh

Lord Tweedsmuir Governor General of Canada, has been elected Chancellor of the University of Edinburgh in succession to the late Sir James Barrie The result of the election, which was by postal ballot was announced at Edinburgh on December 18 as follows

Lord Tweedsmuir	4 802
The Marquess of Lothian	2,582
Majority	2,220

The total poll represented about 50 per cent of the electorate Lord Tweedsmuir, formerly Mr John Buchan, has been Governor General of Canada since 1935 Lord Lothian was the official candidate of the University Court Nomination Committee

Nutrition of School Children

In his annual report on school health administration for the year to July, 1937 Dr George S Clark, school medical officer for the counties of Midlothian and Peebles states that there are very few cases of gross malnutrition and little evidence of under feeding in these counties He believes that as a rule there is not sufficient milk used in the home The supply of milk to school children under the Milk Board's scheme had proved most beneficial, but it would be an advantage if it could be supplied to all children whether attending school or not The percentage taking advantage of this scheme had not been so high as in the first year, and varied in different schools and at different periods of the year, in general 50 or 60 per cent of children took advantage of the scheme Some children asserted that they did not like milk, but if milk were supplied free the percentage of children failing to have their daily ration would be very small The report emphasizes the importance of a definite standard of nutrition The height weight age ratio, it states, could be

achieved unless the Government, either directly or through the local authorities, provides a good deal of financial assistance. Notwithstanding the very obvious difficulties we believe that with the assistance of the medical profession throughout the country the ideal will be realized. We have always been legitimately proud of the high standard of our clinical work and it would be a serious departure from our established standard if anything were left undone for the relief of sufferers from cancer. This is not an academic question of cancer research but of the application of known and approved methods of treatment, while at the same time the co-ordination of all available facilities gives the best chances for systematic and thorough investigation.

Staffing and Status

Upon the question of the efficient staffing of radiotherapeutic centres the remarks of the Commission are worthy of careful consideration. They are of opinion that there should always be at least two radiotherapists attached to every centre. The work of a high voltage x-ray department needs the whole time attendance of a properly qualified radiotherapist and it is recommended that he should act as assistant to the radiotherapist in charge of radium or vice versa. As regards the question of staff, it must also be borne in mind that according to the British X-Ray and Radium Protection Committee workers with x-rays and radium must for reasons of health have long holidays and not work for long hours.

There is, however another problem to be faced and that is one of the greatest importance. It is becoming increasingly evident that the obtaining of trained and experienced radiotherapists capable of taking charge of a centre, is a very difficult matter. This question has already been emphasized by the Radium Commission in its seventh annual report and is also referred to in the memorandum on the Provision of Radiotherapeutic Departments in General Hospitals recently issued by the Ministry of Health. There are two main reasons for this. In the first place an efficient radiotherapist must be a person of very unusual scientific and medical or surgical attainments. Such are obviously not easy to find. The second reason is one that is but little creditable to the ordinary visiting staffs of some of the hospitals concerned. There is in some cases a tendency to regard radiotherapy as a mere adjunct to surgery and the radiotherapist as holding a position subordinate to that of members of the honorary staff. In these circumstances it is hardly likely that the best members of our profession will embark upon a branch of practice necessitating long and arduous study when it is fraught with such manifest disadvantages to their status and emoluments. The report of the Commission leaves no doubt as to the opinion of those best qualified to express an opinion upon the subject.

> The specialist in radiotherapy does not displace but acts in full consultation with the surgeon or other members of the staff. At the same time he should be in effective charge of all the radium and either in charge of or in close touch with the x-ray therapy of the hospital. To ensure this he should be in possession of a high professional qualification and have the status of a member of the honorary staff. In practice however it is found that he must generally be a salaried officer of the Radium Centre and be in a position to attain to an income comparing favourably with that of other members of the staff. There does not at present appear to be much prospect of radiotherapists making a living in private practice and yet having sufficient time to devote to the work which it is necessary for them to do in the Radium Centre. In many hospitals a similar arrangement has been made by the appointment of salaried pathologists who have permission to treat private patients within the hospital. If this latter practice were extended to radiotherapists in charge of centres there would be greater inducement to senior men to take up such appointments.

The question of the status of the radiotherapist is indeed of such importance that we shall probably refer to it again at no very distant date.

The clinical portion of the report deals especially with carcinoma of the cheek, palate, alveolus, fauces and tonsil, and also with the radiotherapy of recurrent mammary carcinoma after surgical operation. Those who are specially interested in these matters are recommended to study the report itself, as it is hardly possible to give a more brief summary than that contained in the original text where the information at the Commission's disposal is clearly and concisely summarized.

IMPERIAL CANCER RESEARCH FUND

THIRTY-FIFTH ANNUAL REPORT

The thirty-fifth annual report of the Imperial Cancer Research Fund announces that the new laboratories in process of erection at Mill Hill should be completed by June of next year. The executive committee has decided to apply to the King, through His Majesty's Privy Council, for the grant of a Royal Charter. The draft of this of the by-laws and of the necessary petition is now being considered by the Committee and also by the Councils of the Royal College of Physicians of London and the Royal College of Surgeons of England.

Director's Report

Dr. W. E. Gye director of the Fund in his report reviews critically the known facts relating to cell grafting and the transplantation of tumours and the frequent misinterpretation of experimental results due to failure to appreciate the significance of these facts. He believes that the resistance to transplantation or the so-called immune state of an animal though of considerable biological interest is not of practical importance. Putnoki has proved that rats which have been injected with mouse embryo skin resist completely transplantation of the Balogh-Ehrlich mouse tumour. Dr. W. J. Purdy has shown in the same way that the injection of chick embryo cells in young ducklings inhibits the successful grafting of fowl tumour cells though in the same circumstances an injection of duck embryo cells has no effect. It has become clear that an animal cannot be "immunized against its own tumour though it can be "immunized" by the injection of a foreign tissue against the transplantation of a foreign tumour. The phenomenon of resistance on which so much work has been done in recent years is simply a resistance to foreign cells whether they be normal or cancerous. A complete explanation of the resistant state is still lacking but the reaction is obviously not specifically related to cancer and affords no hope for cancer treatment. This conclusion has been confirmed by the work of Dr. T. Lumsden and Dr. H. J. Phelps, who have shown that immune serum prepared in a rat by repeated injections of Jensen rat sarcoma tissue does (as Jensen previously claimed) kill the tumour cells of the Jensen rat sarcoma tissue but it also kills normal spleen cells; conversely rats which have been injected repeatedly with normal rat spleen tissue yield a serum which readily kills Jensen sarcoma cells. The important findings are that the immune serum is non-specific and that the wider the genetic difference between the injected animal and the animal from which the cells are taken the more potent the antibody produced.

worked out with some accuracy, but other factors entered into the question and were really more important, although difficult to assess Allowance must be made for lesions of the heart, lung, or nervous system, or defects in structure of muscles or bone

Edinburgh and Aberdeen Graduation Ceremonies

At the winter graduation of Edinburgh University Principal Sir Thomas Holland conferred among other degrees those of M B, Ch B upon forty-three graduands The degree of M D was also conferred upon fifteen graduates and gold medals were awarded to Dr R V Christie for a thesis on "Dyspnoea," and to Professor T B Johnston, Dean of Guy's Hospital Medical School, for a thesis on "A Young Human Embryo"

At a special graduation ceremony at Aberdeen Emeritus Professor A A Jack, in the absence of the Chancellor and Vice Chancellor, conferred the degrees of M B, Ch B upon thirty-two graduands, and that of M D upon three graduates In his subsequent address to the graduates Professor Jack remarked that this day marked for them the end of a long and arduous period of preparation, although this involved less strain upon the most valuable of human faculties than would be exacted by the actual practice of the profession of medicine So far they had not required to reckon with large or sudden responsibilities, and had had experienced men around them, but as busy practitioners they would often have to decide matters at once for themselves

Correspondence

The Problem of the Final M B, B S Lond

Sir,—A document has recently been circulated by the University of London Graduates' Association to medical graduates of the University urging them to support the candidature of Mr P H Mitchiner for a vacancy on the Senate of the University This document contains a long statement signed by the principal officers of the Association, the election address of the candidate, and, on the last page, a list of nominators In this list my name appears, and from conversations I have had with a number of people interested it would appear to be generally thought that I support the views put forward in the statement of the Association and the election address As this is far from being the case, I ask the hospitality of your columns to explain my position in the matter

A month or so ago Mr Mitchiner wrote to me to ask me to support his candidature To this I willingly agreed I have been associated with him for many years, particularly in connexion with the University O T C I owe a great deal to him for the help he gave me when I commanded the Medical Unit He is a man of great energy, he has interested himself in many phases of university life and has special acquaintance with student activities I therefore had no hesitation in signing his nomination paper

It came as a great surprise to me, therefore, to find my name attached to a document with which I have no sympathy whatever I do not know what his other nominators feel, but for my part I think it would have been only courteous to have informed us that our names were to appear on such a document, so that we might have had an opportunity to withdraw This document which is signed by Sir Ernest Graham-Little and two other officers of the Graduates Association, is in fact an attack on the Board of the Faculty of Medicine, which is making another attempt to deal with the problem of the Final M B, B S examination

The fact that only 56 per cent of those who have passed their second M B ever graduate in medicine has become such a scandal that the Universities Grants Committee has had occasion to comment upon it At present nearly half the London University students rely on the Conjoint diploma to obtain a qualification, while the other half find it advantageous to take the Conjoint diploma in addition to their degree, thus entailing two examinations of a similar nature as well as having to pay two heavy fees Thus it would seem only natural that the Faculty Board should consider a conference with the two Royal Colleges desirable when this problem was under discussion It is true that the question of some association between these examining bodies has been considered on previous occasions without result, and it is also true that there are many serious difficulties, not only academic but also financial and legal, to be faced In fact these difficulties may prove quite insuperable But this does not mean that no further efforts should be made to settle this difficult problem There will be ample opportunity at a later stage to object to any concrete proposals which are put forward, and the Senate, which contains only a small proportion of medical members, may be trusted to deal with suggestions which are not in the interest of the University

Unfortunately this form of attack by the Graduates Association is nothing new This Association apparently bases its opposition to a conference on 'the interests of the graduates,' and it appears to think that the fewer people who obtain a degree the better the degree, a doctrine which I believe to be entirely wrong The University of London has to consider primarily the interests of education and of its students, and in these matters the Graduates Association appears to take no interest For these reasons Sir, I wish to dissociate myself from the views contained in the Association's memorandum and in Mr Mitchiner's electoral address—I am, etc,

London, W 1 Dec 18 A M H Gray

The Anti-leprosy Campaign and the "Keep Fit" Campaign

Sir,—Leprosy it is said, is being boosted out of all proportion to its importance from the public health point of view Malaria, it is argued, causes a far greater mortality than leprosy On these grounds, an oversea member of the British Medical Association, speaking at the Oversea Conference at the Belfast meeting last July, objected to the resolution passed by the Representative Meeting on the subject of leprosy This resolution called attention to the urgent need for increased support, by the Governments concerned, of the campaign for the eradication of leprosy in the British Empire The speaker contended that any further funds which such Governments could provide for public health purposes would be much better spent in strengthening the campaign against malaria He was expressing, he said, the view taken by many oversea members

At a recent meeting of the Council of the B M A the resolution on leprosy passed by the Representative Body came up for consideration Here again another speaker raised a similar objection 'It was exceedingly doubtful whether leprosy was the factor which caused the greatest morbidity among uncivilized races Certainly in Africa

Filterable Tumours

Immune bodies of another type, capable of neutralizing the intracellular agent responsible for the growth of filterable tumours have been found in the blood of hens bearing the Fund s connective tissue tumour, Mill Hill Strain No 1 These antibodies will neutralize not only the filterable agent of the No 1 strain but also the highly specific agents obtained from other and different strains of avian tumours Though antagonistic to the virus concerned the immune bodies have no effect on the tumour cells, and therefore, in life, cannot neutralize the virus within the tumour cell The belief of most pathologists that the cell of origin of the commonest slow-growing filterable fowl fibrosarcomata is the fibroblast has been confirmed by Dr R J Ludford Filtered extracts of connective-tissue tumours added to pure cultures of fibroblasts transformed the normal cells into malignant cells which when grafted into chickens produced tumours identical with those from which the filtrate was made Carrel s claim of ten years ago that the cell of origin of the Rous sarcoma is a macrophage has been investigated many times and the results of the experiments undertaken fail to support his view

Carcinogenesis

Dr E S Horning has added to fibroblasts cultivated *in vitro* dilute colloidal solutions of dibenzanthracene in such quantities and over such a period as would have been sufficient to cause tumour formation in the living animal With cells growing outside the body, however, it has so far been impossible to bring about malignant changes The tentative conclusion may be drawn that when a tumour is induced by the action of a chemical substance the living body provides an element which is necessary for the development of malignancy The work of Dr Mary Gilmour on a similar problem suggests that oestrone exerts a general influence which increases the susceptibility of the skin to the local carcinogenic action of 3 4 benzpyrene The degeneration in the adrenals of mice after the prolonged administration of oestrone has also been studied by Dr W. Cramer and Dr Horning Research on this aspect of the significance of oestrone in the causation of malignancy is continuing, and it appears that some connexion will be found between the action of oestrone, the occurrence of mammary cancer, and the appearance of brown degeneration in the suprarenals

In concluding his report Dr Gye suggests that the most important observation in cancer research during the past twelve months has been that of the American geneticists Bittner and Little These observers have previously proved that predisposition to mammary cancer is not inherited along simple Mendelian lines Recently they have taken newborn mice from a strain with a high susceptibility to cancer and had them fostered by mothers belonging to a strain the susceptibility of which was low In mice thus fostered tumour incidence was greatly reduced below that normal for the strain This line of investigation has been carried a stage further by transferring tubal ova from strains of mice with a high cancer incidence to the uteri of mice with a low cancer incidence More than a hundred female mice have been obtained in this way, and to date no cancers have appeared in the series From these and other experiments it seems possible that above and beyond inherited susceptibility to cancer there is a maternal influence, the exact nature of which remains to be ascertained

Social and Economic Factors

In a separate section of the report Professor Major Greenwood has examined the Registrar General s figures for the incidence of cancer in different social and economic groups in the light of certain German literature, which has been abstracted by Dr G Wolff of Berlin The Registrar-General, for the purpose of social or economic discrimination, divides the whole male, occupied and retired, population of adult age into five groups (1) upper and middle class, (2) intermediate, (3) skilled workers, (4) intermediate, and (5) unskilled workers His analysis for 1921–3 suggests that "a large proportion at least of cancer mortality is of a highly preventable nature, for we must suppose that if the conditions of life of all sections of society could be assimilated to those of its upper ranks mortality from cancer of the exposed sites would fall for all classes to the Class 1 level The exposed sites are defined as the upper part of the digestive tract from the mouth to the stomach inclusive, the larynx, the skin, and the breast The objections to this suggestion are considered in the first place from the point of view of the possible variations in the accuracy of diagnosis in different social classes The second objection is directed to the use of standardized death rates instead of figures for a probability of dying Professor Greenwood, after examining these and other objections, concludes that it "seems reasonable to believe that the *prima facie* interpretation of the death rates is correct and that there really is a social factor, or factors, of mortality from cancer It is improbable that statistical research alone will reveal these factors, but the provisional conclusions drawn from the census of 1921 will soon be checked by the results of the census of 1931, and it will be possible to see how far the inferences drawn ten years ago still stand It would be desirable, however, to have at the same time statistics relating to the female population, for a social or economic as distinct from a purely occupational factor should affect in exactly the same way the wives and daughters of the men within the five social groups The Registrar-General already deals with the fertility and infant mortality of these groups and it is understood that in future he will relate also the mortality of wives to that of the social class to which they belong

MEDICINE AND LAW

THE MEDICO LEGAL DINNER

The annual dinner of the Medico-Legal Society was held in London on December 17, Mr Justice HUMPHREYS presiding Four other judges were present—namely, Lord Atkin (Lord of Appeal), Lord Hewart (Lord Chief Justice), Mr Justice Hawke, and Mr Justice du Parcq

Lord ATKIN in proposing what is becoming the time honoured toast of "Medicine and Law," remarked that one of the most important results of the work of the Society was that each profession had learned from the other and exhibited more charity The concern of both professions was the ascertainment of truth For this purpose the lawyer depended upon the veracity of the persons he examined, the medical man had at his disposal more effective means of examination, though occasionally very unpleasant ones On the other hand, the law was accustomed to having its orders obeyed, whereas "doctor s orders ' were not always compelling Lord Atkin added a few remarks on the professional witness saying that the real trouble with this person was that he would never admit that he did not know the answer One of the most effective answers a witness could give to an awkward question was I don t know', it endowed him at once with a reputation for integrity, and perhaps it got him out of a difficult situation

A New Spirit of Understanding

Sir WILLIAM WILLCOX in responding for 'Medicine" recalled that in the responses to this toast in years gone by an effort was made to show the superiority of medicine to law followed by an effort on the part of the responder for 'Law' to exalt his own profession as against the other A different spirit, one of mutual understanding and deference, had now arisen One fundamental difference between

it was not so" He urged that the resolution should be referred to the Dominions Committee before any action was taken

It is well that publicity should be given to these views in order that the question should be fully discussed and the other side of the case stated If these objections cannot be answered a doubt arises as to whether such an organization as the British Empire Leprosy Relief Association—patronized by the King and many high Government officers and supported by many eminent members of our profession—may not be but another example of well intentioned but mistaken zeal for humanitarian causes

In the first place it must be frankly admitted that the mortality from malaria is enormously greater than that from leprosy Has not malaria been called the Captain of the Kings of Death! It is true, on the other hand, that deaths directly due to leprosy are comparatively few Dr Ernest Muir, one of our leading leprologists, has said that one of the sad things about leprosy is that it does *not* kill Its untreated victims are doomed as a rule to lingering years of miserable disfigurement or mutilation, until some other disease, malaria or dysentery, or, it may be, starvation and neglect, put them out of their misery Leprosy *per se* is not usually a fatal disease As regards morbidity too, it must be agreed that, if judged from the point of view of the numbers affected, leprosy takes a subordinate place But when all these points have been conceded, there is still much to be said on the other side Possibly the most forcible reply to our critic is the question asked by a non-medical friend, "Would he himself, if he had to choose, rather have malaria or leprosy?' For leprosy is, among peoples familiar with it, one of the most dreaded diseases

It should hardly be necessary to point out that the duty of our profession is not by any means limited to the prevention of death Large sections of the profession—such as dental and ophthalmic practitioners—are but little concerned with reducing the rate of mortality Their concern is to relieve suffering and make life better worth living by promoting health and happiness In our modern public health services, especially as affecting schools, dental and ophthalmic clinics are rightly given an honourable place The dentist by the relief of toothache or the prevention of a toothless old age the oculist, by the prevention of blindness or the relief of headache and eyestrain that take away much of the pleasure of life, are rendering important services though not obviously influencing the death rate

From the point of view of the need for relief of misery and suffering, leprosy holds perhaps the highest place among the diseases of humanity It is a contagious disease By modern methods it is now curable in the earlier stages The means of prevention are well known Leprologists tell us that it is comparatively easy to prevent and could be stamped out in two generations if only sufficient funds for training and organizing suitable workers were available Taken together these facts may well be urged as presenting a strong case for the anti-leprosy campaign Though far less numerous than malaria the number of cases is considerable In Nigeria for example of a population of 20 millions it is estimated that 1 per cent are lepers There still remains one more cogent argument for the value of modern anti leprosy work as a contribution to public health Leprosy is a disease that gets a hold on communities that have only reached a low level of personal hygiene and sanitation For such communities there can be few more effective health propagandists than a cured leper He will have left his village with his face branded by the hideous marks of his disease—a disease until recently regarded as incurable His neighbours remember him as a miserable beggar dependent on their charity, longing it may be, for death After, say, two years or more in a modern leper settlement, he returns to them smiling, cured of his leprosy He has learned to practise the simple rules of health and happiness These include not only the elementary rules of diet, cleanliness, and sanitation, but also regular occupation in self-respecting work for the community In our keep fit campaign in those dependencies of our Empire where sanitation is only at a low level and leprosy is still prevalent a rightly conducted anti leprosy campaign, run on modern lines, has a value difficult to exaggerate The cured leper can be trained to be, and often is a most admirable apostle of health and happiness to his own people

Briefly to sum up our argument, we would plead that the special features of this disease may well be urged as giving it an importance from the public health point of view not to be measured by statistics of mortality or of morbidity

At this season of the year one more reflection suggests itself The Physician whose birth we commemorate at Christmas left with His followers a definite instruction—Cleanse the lepers Of all the many diseases that afflict mankind this one was singled out for special mention May we not find in this command, not merely pity for these pitiable outcasts, but also a deeper wisdom than we have realized?—We are, etc,

Inhalational Therapy

SIR —Treatment by inhalation is no new discovery, for it has been practised since the earliest days of medicine There are many forms of apparatus on the market for giving treatment by inhalation, and I think it was Laennec who had seaweed put under the bed of certain tuberculous patients so that they might benefit from the smell

I do not think that it is usual to dissociate oneself from any form of treatment because of publicity When the public heard of insulin and it became news and a nine days wonder this did not prevent doctors from using it But in choosing what method of treatment he recommends for his patient the extent to which he is influenced by lay publicity must be a matter for the discretion of the individual doctor

Last year I asked my house physician Dr Mary Lockett to make some investigations into the degree and rate at which certain drugs were absorbed when given by inhalation and to analyse the results of cases we had treated in the hospital Her work was published in the *British Medical Journal* of December 19, 1936 p 1251, and she gave references to several German authors who had recently published the results of their studies on this subject We used a Collison's inhaler because it is worked by compressed air or oxygen and a pressure sufficient to make a vapour of very fine particles can be obtained with a rate of flow of 10 litres there is a pressure of 35 pounds to the square inch and with 15 litres one of 70 pounds and the pressure is an important factor in the absorption of the medicaments—I am, etc.,

L S T BURRELL.

London W 1 Dec 14

the two professions was that law was based largely on precedent and the lawyer was jealous of change, whereas medicine was continually advancing and its medico legal implications were becoming more complex He referred as an example to the introduction into industrial use of such substances as trichlorethylene and various acid gases, all of which had their hazards and gave rise to medico legal problems

Mr Justice HAWKE who responded for Law referred to the interest now taken by medical science in the case of the criminal The first offender—he questioned the application of that term in many cases and expressed doubt as to whether he had ever had a first offender before him—must have his history investigated right back to infancy before his punishment was determined It reminded him of a story from his own West Country of an old labouring man who was set to dig up the roots of an oak tree It was August and the ground was hard and he broke his fork and bent his shovel in the process Presently he stood back and said Darn they pigs as didn't eat thee when thou wast acorn No doubt the explanation of many strange aberrations could be traced back to early years He recalled a case of a man who had a morbid fear of railway trains, and it was discovered that at the age of 5 he had swallowed a little tin figure belonging to a toy engine It was right and proper that the delinquent—who must on no account be called a criminal—should have a course of medical treatment, but the time for such treatment if it could be given was surely in earlier years rather than after the crime was committed

Tribute to Medical Experts

The toast of The Society was proposed by Sir E H TINDAL ATKINSON Director of Public Prosecutions who paid a tribute to those engaged in medico legal cases for the true inferences they drew from very complicated facts The most striking example in recent medico legal history was probably the Ruxton case in which the criminal with a kind of fiendish skill practically succeeded but not quite in destroying the identity of his victims The patient work of the experts in that case and the ultimate convincing result were matters for sincere congratulation Incidentally the public often forgot what he regarded as the unconscious heroism of those who had to handle the pathetic remains of a crime of that character Mr Justice HUMPHREYS in replying referred to the presence at the dinner of two founders of the Society Dr Henslowe Wellington and Sir Walter Schroder The Society had gone on from strength to strength It started with fifty five members and now had 380 Arrangements had been made for the affiliation with it of other medico legal societies and the recognition of branch societies including one in Manchester of which Judge Leigh was president A branch of the parent society had also been formed in Essex He thanked the honorary officers of the Society particularly the two secretaries Mr A A Romain and Dr W G Barnard and the treasurer Sir Walter Schroder for their services Complaint had been made that the medical element in the Society generally provided the papers but that must be so for every doctor knew a certain amount of law whereas the ignorance of the average lawyer of the most elementary facts of physiology was abysmal The function of the lawyer in the Medico Legal Society seemed to be to apply the critical faculty which he was supposed to possess and which his training was expected to give him

Dr R HENSLOWE WELLINGTON proposed the health of the guests and responses were made by Mr Justice DU PARCQ who made some humorous comments on the perfect witness and by Sir ROBERT H PICKARD Vice Chancellor of the University of London who took up the suggestion of a previous speaker that a medico legal institute should be formed in connexion with the University of London, the furtherance of this idea he said depended principally on the endowment which might be forthcoming

CROYDON TYPHOID INQUIRY

HISTORY OF THE OUTBREAK

The tribunal appointed to inquire into the causes leading to the outbreak of typhoid fever in Croydon began its sittings for hearing counsel and evidence on December 20 The inquiry is being held by Mr H L Murphy K C with whom Sir Humphry Rolleston Bt and Mr H J F Gourley, M Inst C E sit as assessors One addition to the list of counsel whose names were given on the last occasion[1] was Mr A H Forbes appearing for the Croydon Division of the British Medical Association and the Croydon Local Medical and Panel Committee It was stated that up to that day the number of cases was 283 and the number of deaths 26 A bulletin outside the town hall gave the names of ten patients who were dangerously ill with typhoid at Mayday Hospital and of twenty three others seriously ill but not in immediate danger

Sir Walter Monckton K C for the Croydon Corporation occupied the whole of the first and part of the second day with an opening statement He said that Croydon had a population of a quarter of a million and there were 56 000 inhabited houses within the borough Its health record was good While the death rate per 1 000 for England and Wales was over 11 for Croydon it was only 10 1 the infant mortality was 41 per 1 000 There were always a certain number of cases of enteric fever in the country there were over 1 800 such cases in England and Wales in 1937 down to the middle of November but in Croydon since January 1 until the present outbreak there had been only ten He briefly explained the mode of onset of typhoid fever and the likely sources of infection The organism was found in soil contaminated with animal matter and in water invaded by sewage He also discussed the possibility of human carriers The position in Croydon now was that the late primary cases were coming to an end most of the new cases could definitely be traced to contact with a primary case The infection was so easily carried by food or water that it was never easy to isolate the source and one of the early difficulties of the Croydon situation was that it could not be assumed that the outbreak was due to water all possible causes had to be eliminated The period of incubation varied from five to twenty three days and even after the onset of illness there was a mean time of eleven days before the symptoms were so severe that the patient called in a doctor or sought admission to hospital.

The Croydon Water

The investigations undertaken (Sir Walter Monckton proceeded) eliminated food or milk as the probable medium and the conclusion was reached that the infection was water borne Attention was directed to what was known as the high level supply from the Addington reservoir When the houses in which cases had occurred up to November 3 were plotted on a map they were seen to follow with remarkable closeness the Addington supply Cases occurred at two schools in this area the schools had no food source in common except pasteurized milk which was ruled out so that here again the common water supply was suggested Some later cases occurred outside the area served by this water but it was found that the people concerned had had opportunities of drinking the high level water at other addresses or that by means of a valve or stopcock their area had been served for a time by this water

The Addington well which was sunk in 1885 was 205 feet deep all in chalk and 10 feet in diameter Its maximum yield was two million gallons a day its minimum one million gallons The well supplied the reservoir but it also supplied water direct to the Warlingham Mental Hospital three miles away where there was a 30 000 gallon tank It was surprising that only one case and that not an early one had occurred at that hospital In 1910 three sand filters were brought into use and were replaced in 1928 by new filters of rapid pressure with a chlorinating apparatus as a stand by and in 1936 an

Correct Footwear

SIR—Dr Thomas Marlin (*Journal* December 11, p 1198) has invited the attention of the medical profession to what constitutes correct footwear Observations suggest that, in addition to physical deformities and injuries of the feet, incorrect footwear is the cause of a considerable amount of inattention, irritability, fatigue, in fact, of dis-ease (lack of ease) Probably 'incorrect' socks and stockings, lack of personal hygiene, etc, are in some cases contributory causes, but on the whole these mental and physical dis eases are due to unsatisfactory boots and shoes

Mr Bernard Shaw has upbraided the middle-aged Englishman for his preference for spending his evenings by his own fireside instead of patronizing the theatre Mr Shaw appears to have overlooked not only the joyful relief the Englishman experiences when changing into his slippers but the fact that playwrights, artists, deans, professors, and other eminent people almost invariably do their best work shod in slippers which outrage the aesthetic sense of their household Even Mr Punch, save when hunting with Toby, knows how to forget his feet How can a man be cheerful if he is conscious of his feet? The definition of correct footwear is not without difficulty To the doctor and to many laymen the criteria of 'correctness would be such size, shape, and quality as to ensure unconsciousness of one's feet But to many men and women the style of footwear is of great importance, and to most people its price is all-important

It would appear that we are at the mercy of the boot and shoe manufacturers, who are probably the best source of information as to what quality of materials, style (fashion), and prices suit the public Possibly they might be induced to accept guidance from the medical profession as to the "correct" size and shape of footwear and the elimination of materials known to be deleterious to the human foot Comfortable, and to me eminently satisfactory, footwear can be purchased at the higher prices After much searching I have found that the cheapest price at which I can purchase such correct ' shoes is 35s per pair, comparable prices obtain for the "correct" footwear for my wife and children I find that the cheaper grades, even from the same factory, are "incorrect", they are not only of inferior quality but (what is of major importance) their shape or fit is most unsatisfactory Why should cheap shoes be made on a different model from the more highly priced?

The correct shoeing of horses has engaged the close attention of the British veterinary profession since its foundation in the eighteenth century For 150 years veterinary students have been required to take a thorough course of instruction in the manufacture, fitting, and use of horses' shoes Thus for many years the initiative in the correct shoeing of horses has been taken by the veterinary profession Is it not in the public interest that the medical profession should be equipped with the knowledge for directing the correct shoeing of man?—I am, etc,

St Albans Dec 14 TOM HARE

Parkinsonism following Peripheral Trauma

SIR—I feel that the letter of the Director-General of the Pensions Medical Services (*Journal*, November 6, p 934) stands in need of answer I only regret that I must particularize where he generalized He attempts the justification of his decision (1) on the fact that the incidence of Parkinsonism among war-wounded men is no greater than that among the civilian population, and (2) on the postulate that the most common cause of Parkinsonism in people under the age of 40 being encephalitis lethargica, it is most probable that this man was an undiagnosed case Surely Dr J H Hebb is no less guilty than I am in falling into the age old fallacy of *post hoc ergo propter hoc*—and he must even assume the *hoc* Furthermore, during the years 1921–4 the man lived not in Ashford but in Dover, twenty-four miles away, where there were in all three notifications of encephalitis lethargica in these years In other words, if this application had come before the civil courts the case for the plaintiff would be something like this

In 1916 my client, a soldier, received a gunshot wound in the arm which was followed by stiffness and tremor resulting in his not being allowed to do further active service This condition slowly spread over his whole arm then over one side of his body, and later over the whole of it My case is that the injury was the determining factor of his present condition And now let me deal with the argument put forward by the defence It is that my client contracted a rare disease, encephalitis lethargica between the years 1921 and 1924—why between these years I do not understand—and *having contracted it was unaware that he had done so* Moreover, this disease is so rare that in these four years only three women out of a total population of 41,000 people are known to have suffered from it Not only that, but by some fortuitous coincidence the spot in which the disease attacked him was the site of his old war wound Therefore, since the case for the defence is built on so fantastic a theory coupled with a still more fantastic coincidence, there can be only one verdict.

That trauma does play a definite part in some diseases of the nervous system is now accepted While I am the last person to dogmatize, I would contend that this man is a pensionable subject provided his records—if still extant—show that before 1918 he showed stiffness, weakness and tremor, and complained of pain in his right hand, and that this syndrome coupled with his subsequent history, which conforms to the characteristics of Naville and De Morsier, cannot be ignored—I am, etc,

Ashford Kent, Dec 17 JOHN C HODGSON M D

The Fevers and Granulomata in their Pathological Relationship

SIR—In reviewing the fevers we observe that the rash comes out early in scarlet fever and chicken pox and late in enteric fever The infecting organisms appear to attack the throat first in scarlet fever and diphtheria and the nasal mucous membrane and throat in measles, while in enteric fever the bacillus seems to fasten first on the lymphoid tissue of the bowel

Measles and whooping cough give rise to pulmonary complications, scarlet fever to renal disease, and the pneumococci favour serous membranes, particularly the pleurae, peritoneum, and the membranes of the brain Enteric fever, in addition to infecting the lymphoid tissue of the bowel, mesenteric glands, and spleen, may likewise involve the spinal cord, bronchial mucous membrane the ear, kidney, bladder, etc Typhus fever specially selects the lungs and brain Tuberculosis favours lymphatic tissues, the lungs, and serous membranes Small-pox gives rise to complications of a suppurative character The toxins of tetanus and hydrophobia show a selective preference for nervous tissue The toxin of scarlet fever has a specially irritating action on the heart, while the toxins of typhus fever and diphtheria depress its action seriously The germ of influenza selects the pulmonary tract and its toxins are specially irritating to the sheaths of the voluntary muscles

ammoniator was added In January 1937 there was a fatal accident at the well, and the chlorinating apparatus was brought into play to avoid any risk of contamination and again in May when it was found that clay was breaking into the water

Monthly samples of the water of this as of the other sources were taken and analysed, and reports sent to the medical officer of health and others The samples were taken not at the well, but at the outlet of the reservoir going into the supply In September 1937 and until the end of October certain engineering work took place at the well, and later, after the outbreak of typhoid had occurred, the possibility was considered of a carrier among the workmen On November 15 samples of blood were taken from eighteen workmen who had been employed on this work, and one man who had been working in the headings intermittently was found to be a potential carrier

Measures taken by the Corporation

Sir Walter Monckton detailed at length the measures taken by the Corporation from the time the outbreak assumed serious proportions He put in tables showing the hospital accommodation available on various dates There had never been a lack of such accommodation, and at the moment some sixty beds were available of which no use was made The first case was that of a woman who felt ill on October 8, after returning from a fortnight s holiday in France, where she had eaten some suspected oysters Her case was diagnosed as typhoid fever on the 19th This case appeared to have no connexion with the Croydon outbreak proper, but, curiously enough, it occurred in the same neighbourhood, St Augustine s Avenue W S W Croydon, in which several of the early cases arose The second case was admitted to hospital on October 25, and by the 29th there were four cases An analysis of a sample of water from the Addington distribution main—the ordinary monthly analysis—referred to the appearance of *B coli* in 10 c cm , which was attributed to recent rainfall The analyst said the water was good, but he thought the chlorinator should be used as a precaution, and the water accordingly was chlorinated at 0 1 part per million By November 1 there were seven cases Counsel detailed the exhaustive inquiries made and measures taken by the sanitary inspectors at the house of each victim The Ministry of Health was informed of the outbreak on November 1 , on the following day the medical officer of health telephoned the Ministry and asked for help, and on November 3 Dr E T Conybeare of the Ministry s staff arrived and gave the advantage of his assistance from that time onwards On November 1 also the twenty six doctors of South Croydon were circularized by the medical officer and this was followed on the 4th by a circular to all the 133 doctors in the borough, asking them to keep the possibility of typhoid in mind

Co-operation with Local Profession

In the Croydon area co-operation between the medical officer and private practitioners had been manifested previously in other directions, and the medical officer felt that he could rely upon skilled diagnosis and prompt notification by the members of the local profession On November 9 by which date there were twenty nine cases, statements were made by the medical officer and by the chairman of the public health committee to the town council, and on the same date a meeting of the Croydon Division of the British Medical Association took place, at which a resolution was unanimously passed deploring the fact that the first intimation of the outbreak to medical practitioners was made through the medium of the daily press, and expressing the opinion that earlier notification of such outbreaks would be of assistance To this the town clerk replied on the 15th that the public health committee was informed that notification was sent to the medical practitioners in the area affected at the earliest possible moment, and three days later a communication was made to all the doctors in the borough The town clerk added that the committee did appreciate the need for the earliest possible notification to members of the profession and was most anxious to have the closest co operation with practitioners

Early in November the Addington source was suspected Samples were sent to the Ministry s laboratories and on the 4th a report was received showing that the water was highly contaminated Pumping from Addington well was then stopped except for the Warlingham Mental Hospital where it was the only source of supply and where special precautions of chlorination were taken On November 8 another report from the Ministry s laboratories showed that *B coli* of faecal type had been isolated from 0 1 millilitre of this water On the following day Dr E V Suckling, consulting water analyst and bacteriologist was called in and two days later it was possible to report that the water supply of Croydon was sterilized and satisfactory On November 12 a statement was issued to the Press and the B B C by the Minister of Health stating that the source of infection had been found but that owing to the long period of incubation it was impossible to say how many new cases might occur , it was not thought that they could be very numerous, because only one twentieth of the Croydon population was at risk The corporation did not agree with this latter figure in its view one-sixth would be a more accurate proportion

The chairman remarked that it was important to have some idea of the number at risk, because the Croydon outbreak differed from outbreaks in other towns where in the case of the water supply, the whole population was at risk

Sir Walter Monckton who had spoken for four hours, had not concluded his opening statement when the first days proceedings ended

Alleged Defects in Medical Administration

In completing the case for the Croydon Corporation on the second day of the hearing, Sir Walter Monckton referred to the letter which appeared in the *Times* of November 22 above the signatures of Lord Dawson and Sir Kaye Le Fleming. The writers of the letter stated that they did not wish to discuss the cause of the epidemic but to draw attention to defects in medical administration when its existence had become established I cannot help feeling said counsel that the distinguished signatories overlooked the fact that not only were the causes of this outbreak *sub judice* but also the steps taken to combat it Anxious though they were not to prejudge the matter on the one issue, perhaps on reflection they will feel that they might have refrained from prejudging the matter on the other He would not have turned aside to deal with this point but for the eminence of those who had signed the letter The gravamen of the letter was that the medical officer of health should have sought the help of the best medical talent which Croydon possessed It was suggested that a defect had become manifest in Croydon in the shape of non coordination It is open to some question said Sir Walter Monckton, whether that was a timely intervention having regard to the fact that the medical officer of health was precluded from replying in view of the present inquiry He now has his opportunity to say to you that he is not conscious of being a party to a defect of that kind'

It was necessary to think precisely on this matter when considering the passing of judgment upon an administrative body or the executive officer of that body It was not enough to say that co-operation was an admirable thing Co operation implied, not a mixing up of functions but a uniting of the functions of different persons engaged in different kinds of work towards a common end The medical officer of health was assisted from November 3 onwards by a medical officer of the Ministry (Dr Conybeare) So far as the local doctors were concerned, he yielded to no one in saying that they were distinguished in their profession, and in the ordinary exercise of their duty they were diagnosing these cases as soon as they could and furnishing the authority with information On November 1 the doctors of South Croydon were informed of the outbreak, and on November 4 all the doctors in Croydon were circularized It was said that the medical officer of health ought to have formed a committee including representatives of the local profession But the amount of work he was having to do at that juncture

There likewise seems to be a periodicity of seven days, or multiples thereof, in the pyrexia of the fevers Thus, seven days usually cover the febrile period of measles and scarlet fever, and about the same period that of pneumonia Rheumatic fever, when untreated, is considered to run a period of fourteen days, fourteen days cover typhus fever, and twenty one days is the normal period for enteric fever

Pyogenic infections appear to run an indefinite course and when they complicate diseases due to a specific organism they prolong the illness sometimes indefinitely The rise in the temperature is quick and sudden in scarlet fever, influenza, typhus, and pneumonia, but gradual in enteric fever, the fall is also abrupt in pneumonia Local treatment of the throat is of paramount importance in diphtheria and probably also in scarlet fever and rheumatic fever The defensive reaction to the invading organism, as represented by the inflammatory response, is very marked in pneumonia, erysipelas, and cerebrospinal meningitis—diseases due to cocci In the first two leucocytosis is usually highly developed, but leucocytosis is deficient or weak in tuberculosis, and notably so in enteric fever

Certain bacilli, such as the tubercle bacillus and that of leprosy, have a stimulating influence on the cells of the tissues, causing granuloma tumours, while in the cancers cell proliferation reaches its highest development of all the diseases known but the inflammatory reaction is usually feeble or slight and the leucocytosis is not pronounced

These considerations seem to me to establish a pathological affinity of all the above diseases showing an inflammatory reaction common to them all, but differing in the amount of the exudation and in the stimulation of the cells of the tissues In my opinion they bring the cancers into pathological relationship and suggest a similar causation—probably an intracellular parasite—I am, etc,

Induced Silicosis and Cancer

SIR—In the recent review of pneumoconiosis published in the *American Journal of Roentgenology* Pancoast and Pendergrass[1] state that among the many hundreds of cases of pneumoconiosis which they have examined or whose roentgenograms they have had the opportunity of studying, they have never seen a case of carcinoma of the lungs In the ordinary course of events we should expect, as in sweeps cancer or pipe smokers cancer that irritating substances such as the sharp spicules of silica (SiO_2) would predispose to or cause cancer

The question naturally arises Is the presence of silica in the lungs antagonistic to the growth of cancer? A brief summary of the cause of miners phthisis as given by the above named authors[2] shows that silica in the form of dust on being inhaled into the lungs and on reaching the alveoli causes irritation to the alveolar cells which become phagocytic for the smaller dust particles of 0 1 micron or less These cells are macrophages which have been termed dust cells The dust cells enter the lymphatic system where they congregate in the lymph channels and fibroblasts are produced which ultimately become fibrous tissue Fibrous tissue begins in and around the various lymphoid deposits forming a nodular fibrosis along the course of the vascular and lymphatic systems This process is continued until the small areas enlarge sufficiently to become macroscopic and the lymph channels become blocked In the case of miners and other workers in silica the object is to prevent the entrance of dust into the lungs Where cancer is concerned, however silicosis might purposely be produced, which would block the lymphatics and finally cause a fibrosis of the whole tumour

An immense field of research is thus opened up It has been ascertained[3] that alkalis enhance the action of silica and that concomitant tuberculosis also quickens the production of fibrosis of the lungs Kettle[4] produced fibrosis by the subcutaneous injection of silica (SiO_2), and Mavrogordato[5] caused fibrosis in the peritoneal cavity by dusting it with sterile silica In the case of cancer the tumour might be surrounded by a ring of silicosis which would act by first blocking the lymphatic channels and by finally causing a fibrosis of the whole tumour—I am, etc,

Cataract Extraction during Narcosis

SIR,—I have read with interest the correspondence in the *Journal* following Mr Basil Graves's article on the technique of cataract extraction during narcosis (August 14, p 319) For fear that some misconception as to the value and uses of paraldehyde may be produced in the minds of your readers, may I point out several important facts with regard to its rectal administration? Paraldehyde is, I am convinced, the safest basal hypnotic, I have given it for sixteen years in full doses of 1 drachm per stone body weight (with or without omnopon) with the greatest satisfaction to both patients and surgeons It has been used by others in many thousands of cases and I believe I am correct in saying that there have been fewer reports of trouble than with any other similarly used drug It is particularly safe in the very old and the very young and, except in the most advanced cases, arteriosclerosis, chronic nephritis, and diabetes are not contraindications It has been mostly used before a general anaesthetic, and it is a significant fact that when general anaesthesia and surgical shock are added patients who have had paraldehyde are generally fitter than those who have not This speaks well for its low toxicity

I am also in the habit of giving repeated small doses of paraldehyde (1 to 4 drachms) after operation in order to tide the patient over the discomfort of the post-operative period It seems hardly necessary to point out the difference between basal anaesthesia and this narcosis The former is a condition of coma often attained as a preliminary to surgical anaesthesia and it lasts for only a short period (averaging two to three hours) In addition to its psychological advantages it greatly lessens the amount of anaesthetic necessary It is used for the actual operative period in Mr Graves's cases it is neither necessary nor advisable after operation There supervenes a period which can be kept up almost indefinitely the patient remains asleep until aroused when he may be fed or otherwise attended to and will drop off to sleep again immediately he is left alone—I am etc

STANLEY ROWBOTHAM

London W 1 Dec 13

SIR—Mr D V Giri (*Journal* December 4, p 1143) asks for information I may point out that the technique I have described involves the use only of paraldehyde and

ammoniator was added In January, 1937 there was a fatal accident at the well, and the chlorinating apparatus was brought into play to avoid any risk of contamination, and again in May when it was found that clay was breaking into the water

Monthly samples of the water of this as of the other sources were taken and analysed and reports sent to the medical officer of health and others The samples were taken not at the well, but at the outlet of the reservoir going into the supply In September, 1937 and until the end of October, certain engineering work took place at the well, and later, after the outbreak of typhoid had occurred, the possibility was considered of a carrier among the workmen On November 15 samples of blood were taken from eighteen workmen who had been employed on this work and one man who had been working in the headings intermittently was found to be a potential carrier

Measures taken by the Corporation

Sir Walter Monckton detailed at length the measures taken by the Corporation from the time the outbreak assumed serious proportions He put in tables showing the hospital accommodation available on various dates There had never been a lack of such accommodation, and at the moment some sixty beds were available of which no use was made The first case was that of a woman who felt ill on October 8 after returning from a fortnight's holiday in France, where she had eaten some suspected oysters Her case was diagnosed as typhoid fever on the 19th This case appeared to have no connexion with the Croydon outbreak proper, but, curiously enough, it occurred in the same neighbourhood, St Augustine's Avenue W S W Croydon in which several of the early cases arose The second case was admitted to hospital on October 25 and by the 29th there were four cases An analysis of a sample of water from the Addington distribution main—the ordinary monthly analysis—referred to the appearance of *B coli* in 10 c cm, which was attributed to recent rainfall The analyst said the water was good, but he thought the chlorinator should be used as a precaution, and the water accordingly was chlorinated at 0 1 part per million By November 1 there were seven cases Counsel detailed the exhaustive inquiries made and measures taken by the sanitary inspectors at the house of each victim The Ministry of Health was informed of the outbreak on November 1, on the following day the medical officer of health telephoned the Ministry and asked for help and on November 3 Dr E T Conybeare of the Ministry's staff arrived, and gave the advantage of his assistance from that time onwards On November 1 also the twenty six doctors of South Croydon were circularized by the medical officer and this was followed on the 4th by a circular to all the 133 doctors in the borough asking them to keep the possibility of typhoid in mind

Co-operation with Local Profession

In the Croydon area co-operation between the medical officer and private practitioners had been manifested previously in other directions and the medical officer felt that he could rely upon skilled diagnosis and prompt notification by the members of the local profession On November 9, by which date there were twenty nine cases statements were made by the medical officer and by the chairman of the public health committee to the town council and on the same date a meeting of the Croydon Division of the British Medical Association took place at which a resolution was unanimously passed deploring the fact that the first intimation of the outbreak to medical practitioners was made through the medium of the daily press, and expressing the opinion that earlier notification of such outbreaks would be of assistance To this the town clerk replied on the 15th that the public health committee was informed that notification was sent to the medical practitioners in the area affected at the earliest possible moment, and three days later a communication was made to all the doctors in the borough The town clerk added that the committee did appreciate the need for the earliest possible notification to members of the profession and was most anxious to have the closest co operation with practitioners

Early in November the Addington source was suspected Samples were sent to the Ministry's laboratories, and on the 4th a report was received showing that the water was highly contaminated Pumping from Addington well was then stopped, except for the Warlingham Mental Hospital, where it was the only source of supply and where special precautions of chlorination were taken On November 8 another report from the Ministry's laboratories showed that *B coli* of faecal type had been isolated from 0 1 millilitre of this water On the following day Dr E V Suckling consulting water analyst and bacteriologist was called in, and two days later it was possible to report that the water supply of Croydon was sterilized and satisfactory On November 12 a statement was issued to the Press and the B B C by the Minister of Health stating that the source of infection had been found but that owing to the long period of incubation it was impossible to say how many new cases might occur, it was not thought that they could be very numerous, because only one twentieth of the Croydon population was at risk The corporation did not agree with this latter figure, in its view one-sixth would be a more accurate proportion

The chairman remarked that it was important to have some idea of the number at risk, because the Croydon outbreak differed from outbreaks in other towns, where, in the case of the water supply the whole population was at risk

Sir Walter Monckton who had spoken for four hours had not concluded his opening statement when the first day's proceedings ended

Alleged Defects in Medical Administration

In completing the case for the Croydon Corporation on the second day of the hearing Sir Walter Monckton referred to the letter which appeared in the *Times* of November 22 above the signatures of Lord Dawson and Sir Kaye Le Fleming. The writers of the letter stated that they did not wish to discuss the cause of the epidemic but to draw attention to defects in medical administration when its existence had become established 'I cannot help feeling said counsel that the distinguished signatories overlooked the fact that not only were the causes of this outbreak *sub judice* but also the steps taken to combat it Anxious though they were not to prejudge the matter on the one issue, perhaps on reflection they will feel that they might have refrained from prejudging the matter on the other He would not have turned aside to deal with this point but for the eminence of those who had signed the letter The gravamen of the letter was that the medical officer of health should have sought the help of the best medical talent which Croydon possessed It was suggested that a defect had become manifest in Croydon in the shape of non coordination It is open to some question said Sir Walter Monckton, whether that was a timely intervention having regard to the fact that the medical officer of health was precluded from replying in view of the present inquiry He now has his opportunity to say to you that he is not conscious of being a party to a defect of that kind'

It was necessary to think precisely on this matter when considering the passing of judgment upon an administrative body or the executive officer of that body It was not enough to say that co-operation was an admirable thing Co-operation implied, not a mixing up of functions but a uniting of the functions of different persons engaged in different kinds of work towards a common end The medical officer of health was assisted from November 3 onwards by a medical officer of the Ministry (Dr Conybeare) So far as the local doctors were concerned, he yielded to no one in saying that they were distinguished in their profession, and in the ordinary exercise of their duty they were diagnosing these cases as soon as they could and furnishing the authority with information On November 1 the doctors of South Croydon were informed of the outbreak, and on November 4 all the doctors in Croydon were circularized It was said that the medical officer of health ought to have formed a committee, including representatives of the local profession But the amount of work he was having to do at that juncture

omnopon without the addition—which is by no means uncommon—of chloroform or ether, and without the stress of a major operation

The first letter from Mr Giri (October 2, p 681), referring to the feeding and to the evacuation of the bowels and bladder of an unconscious patient, suggested that before attempting to raise these questions he had visualized them without seeking, say, to visit some hospital where he could see patients asleep under paraldehyde and omnopon Their sleep either is or soon becomes of a kind which is not heavy and from which they can be roused, or from which they rouse themselves spontaneously to ask for attention It may be noted that the use of a local anaesthetic for the eye operation is still necessary with "narcosis" In my letter of November 20 (p 1047) I did not discuss the use of morphine and scopolamine before cataract extraction because I have been biased doubtless unduly, by the fact that when I saw it used by more than one surgeon in some few cases in 1921 and 1922 vomiting ensued in one or two cases, and delirium in one instance The late Lieut-Colonel R H Elliot told me in 1922 that he used trivalin hyoscine, but had had cases in which vomiting followed Ophthalmic surgeons have seemingly long felt the need of some sort of narcosis, but have usually disliked the feeling that if it is carried "too far technical difficulty arises from abolition of the patient s co-operation My feeling has been that if co operation is interfered with it is best abolished and that an intermediate state which is neither one thing nor the other can be very inconvenient, but perhaps the experience of Miss Ida Mann (Mr Laws s letter, October 16 p 778) and of Mr Giri will correct this bias It is helpful to know that Mr Giri has, after such a long experience, found morphine and scopolamine satisfactory

I was led to the use of paraldehyde thus a diabetic was seized with intractable vomiting after cataract extraction, at the end of twenty-four hours, when the condition was desperate and after various remedies had been tried unsuccessfully, paraldehyde and bromide, rectally, was suggested and given The patient quickly went into semi-sleep and the vomiting ceased promptly Omnopon 1/4 grain for a person of 7 to 9 stone, or 1/3 grain for a person of 9 to 15 stone, is not a heavy dose, and omnopon is a very commonly used drug I myself have not had occasion to operate on severe cases of diabetes or nephritis since I have used narcosis" In a communication in preparation I will give, in detail which is impossible here, an account of the cases dealt with I had not foreseen the subject of "simple intracapsular extraction" being raised as the outcome of my article I have had practically no experience of it, save as an onlooker—I am, etc,

London W 1, Dec 13 BASIL GRAVES

Traumatic Perirenal Haematoma

SIR—In your issue of to-day s date (p 1251) Dr A L Craddock asks what my advice would have been to stay the torrential haemorrhage which followed the opening of a perirenal haematoma

I once had a similar case and I passed my left hand into the depths of the wound, grasped the renal pedicle between the finger and thumb then blindly placed a long haemostat under my fingers The anaesthetist reported that the pulse could not be felt, so I left the forceps *in situ* As I withdrew my hand the kidney came out of the wound with the blood clot—it was completely avulsed from its pedicle There was no time to suture the wound With intravenous saline, and later blood transfusion, the general condition improved On the fifth day the ratchet of the haemostat was loosened, and in the evening it was withdrawn There was no further haemorrhage, and the wound healed as well as if it had been meticulously approximated

This, however, was a case of recent injury, and in Dr Craddock's case no doubt the pedicle would have been friable and the forceps would probably have cut through—I am, etc,

London, W 1, Dec 18 HAMILTON BAILEY

Haematocolpos

SIR—In the seven weeks since my arrival here two cases of this condition have been encountered, they have shown some interesting features which may merit record The mere fact that two cases should be met with in so short a period when the records of the hospital do not show a single similar case is somewhat strange, though relatively rare conditions must always have a curious incidence

The first patient, aged 17, presented with amenorrhoea On examination she appeared a normally developed girl Per abdomen a large firm oval mass was palpable reaching just above and to the right of the umbilicus Per vaginam a septum which was probably not an imperforate hymen but the uncanalized lower end of the Müllerian ducts, was visible It moved with the abdominal mass but did not bulge and was one-quarter of an inch in thickness At operation this case presented no difficulty except that the constant flow of retained menses made it difficult to oversew the cut edges

The second patient was a girl of 16 who complained of a lump in the abdomen a history of primary amenorrhoea was obtained on inquiry Examination elicited the following Per abdomen a globular mass freely mobile in all directions was palpable in the lower abdomen Though evidently arising out of the pelvis, and apparently uterine no swelling could be felt connecting it with the pelvis The vagina appeared normal for two and a half inches at which point was a septum with an irregular central nodule it was difficult to say whether this was not the vaginal vault with a deformed cervix The balance of evidence was in favour of haematocolpos, but having had a case so recently I hesitated to make the diagnosis again, however, it was confirmed by aspiration In this case the operation was not so straightforward The girl was unmarried and the vaginal ostium barely admitted the smallest speculum The fingers obscured the field of operation, and it was necessary to check one s position constantly by means of an exploring needle, which at one time drew a few cubic centimetres of urine from the bladder and at another distinguished a bulge in the upper part of the vagina as due to the abdominal swelling falling back on the rectum and pushing it forward The difficulties were due to the high septum being almost invisible through the narrow ostium The septum itself was about three eighths of an inch thick, and had to be removed in layers to prevent the flow of menses terminating the visibility too soon As it was, the septum when penetrated had to be broken down manually the parts being then invisible In both cases the tumour had disappeared at the end of the operation and recovery was uneventful

Not, unfortunately, having access to the literature in this remote station, my only source of information being Eden and Lockyer's *Gynaecology* I should be grateful if anyone with experience of this condition could kindly enlighten me concerning the operative technique where the septum, as in the second of the above cases, is dense and at the junction of the upper third and lower two-thirds of the vagina It would be interesting also to hear how often this condition is encountered in unselected practice at home—I am etc.,

C.M S Hospital Zaria, Northern Nigeria A L CRADDOCK M B, B.S

must be remembered the committees such as Water and Public Health, to which he was constantly having to report the collaboration which he had to keep up with the borough engineer and his staff with the medical officer of the Ministry and with Dr Suckling the water analyst and bacteriologist, who were continually making suggestions to him for appropriate action It is hard to condemn the medical officer of health because he did not favour at that stage a co-ordination which would take the form of a new committee to which medical practitioners could be attached Whether that was right or wrong, I am not conscious of any medical practitioner inside or outside the borough having made a suggestion to the medical officer concerning steps he should have taken which was not considered and dealt with I am not complaining of the contents of the letter but I am only anxious that you should have the material before you to decide not only whether the letter was timely but whether the criticism was justified

It was announced that the first witnesses to be examined would be a geological expert then a water engineer and afterwards the medical officer of health

Reports of Societies

THE INTRODUCTION OF NEW REMEDIES

In his presidential address to the Section of Therapeutics and Pharmacology of the Royal Society of Medicine on December 14, Dr J W TREVAN dealt with the introduction of new remedies into clinical practice

The science of therapeutics he said was still in its infancy, and no great generalizations such as the structure of the benzene ring or the theory of evolution had come along to aid the task of discovering new remedies A large number of new remedies had been introduced on purely empirical grounds and it could not be finally predicted that the latest products were worthy of addition to the physician's bag until they had been fully tried out on man What might be called the scientific era in therapeutics did not begin until the end of the eighteenth century The first step was to remove from the *Pharmacopoeia* the drugs which owed their inclusion to superstitions of various kinds The next step was the work of the chemist in isolating pure active principles from the various plants in use One curious fact which came out in the examination of alkaloids was that in no case of which he was aware had a useful alkaloid been extracted from a plant from which some preparation had not been previously used therapeutically The number of new useful alkaloids produced grew fewer every year ergometrine was an example of the latest of this group Ether and chloroform were introduced in the middle of the nineteenth century It was not until the eighties that the spate of synthetic or organic preparations began to flow The more modern developments might be divided into three groups (1) those arising from the working out of the factor of immunity (2) the development of the hormone and vitamin physiology (3) the production by the organic chemist of synthetic remedies of all kinds

In the first of these groups which included antitoxins and sera some valuable remedies had been forthcoming but too often the excellence of the work in the laboratory had not been maintained in the final steps of clinical application though the position was improving A few dramatic recoveries after the administration of a new remedy were apt to raise in the mind of the physician a feeling that he was failing in his duty if he did not treat every case with it But a few apparently favourable cases might be only a statistical accident If he was prepared to take the risk of administering a new product to a series of patients he should be prepared to take the risk of withholding the remedy from some patients until a probability was established, greater, say, than ten to one, that the material was active

In the course of some further observations Dr Trevan mentioned insulin as an almost perfect example of the way in which a new remedy should be brought into use The material was not set free as a commercial product until the most stringent clinical proof was obtained It was perhaps too early to evaluate the clinical use of the sex hormones and preparations of the anterior pituitary, but the claims for these products considerably antedated any evidence of their special uses Vitamin A was recommended for protection against acute infections That idea arose from experiments on animals in which the infective condition was quite a different thing and depended primarily on the alteration of the epithelium Vitamin B was now recommended for constipation There was some animal evidence that could be brought forward, but he did not believe there was any proper clinical comparison with man As for the drugs produced synthetically, the happy hunting ground of the synthetic chemist for many years was the barbituric acid derivatives Chemotherapy was now one of the chief growing points of therapeutics, and medical men might look forward to a considerably enlarged volume of circulars While old superstitions had been banished, it was a melancholy prospect if the house swept and garnished' was to be occupied with worse devils in the form of pseudo scientific jargon Statements were made with assurance which were demonstrably untrue Mixed up with such stuff were reasoned and scientific recommendations of drugs of proved value but he thought the rubbish outweighed the good Of all superstitions the pseudo scientific superstition was the blackest

Advertisement of Remedies

Who was to blame for these things? The amount of money spent on them was enormous It was spent by business concerns, so that presumably it brought its return The medical profession perhaps got the advertising it deserved These advertisements must mean that there was a response on the part of the medical profession He had taken one leading medical journal and tried to classify the advertisements of remedies They were forty three in number and from a lenient standpoint, only twenty seven of them might claim to have some foundation of laboratory and/or clinical fact thirteen were untrue misleading or simply silly, and three he could not classify because they appeared under proprietary names and gave no sort of idea of the composition of the material In contrast he took the *Journal of the American Medical Association* It contained only thirteen advertisements of medicinal agents, of which he would have rejected only one and he was not sure about that one He supposed that the welter of cult medicine in America had made the medical profession examine its therapeutics with more care than had been exercised in this country The state of advertising literature in this country suggested to him that the medical profession was not sufficiently critical of new preparations It might be argued that useless preparations did no harm It was inevitable in the present stage of therapeutics that many things should be done to patients for which strict scientific justification could not be produced, but at least they should be done with open eyes

The provision in this country of scientific work on the action of drugs ought to be greatly increased Dr Trevan regretted that in the London School of Hygiene and Tropical Medicine and the British Postgraduate School such departments had not been considered necessary For postgraduate education particularly a department in which it was the business of the teacher to provide a critical estimate of the many new drugs appearing should be established and as much time devoted to it as was now devoted to anatomy Unless some academic institutions outside commercialism took action treatment was likely to be swamped in this new era of therapeutics by a mass of good, bad and indifferent material provided by manufacturers and accepted uncritically by the profession He

Radiological Imagery

SIR,—However much one may dislike littering up such a valuable feature as your correspondence columns with trivial matters, I feel that Dr Ffrangcon Roberts's letter (*Journal* December 11, p 1199) cannot be allowed to stand unchallenged

In spite of the fact that the verb to visualize is most often used in the intransitive (relating to clear mental pictures) it is still grammatically correct to use it on occasion in the transitive (relating to the physical sense of sight) If however the transitive verb has by some form of Cambridge magic been deleted from our language the use of the term is all the more correct Is it not usually a mental picture to which the radiologist refers when he speaks of visualizing a structure? In the examination of the appendix for instance any person with normal sight is able to say that he can see the skiagraphic shadow cast by opaque or other contrast matter in the lumen of the appendix which *per se* is meaningless in the majority of cases But the radiologist, after careful examination by fluoroscopic visual palpation aided by past experience of excised specimens etc, is entitled to form a mental picture of the actual state of the organ In the same way even a layman may see on a skiagram an anomaly in the distribution of an opaque medium in the stomach but the radiologist again by his fluoroscopic observations as to behaviour etc coupled with his knowledge of pathology must try to form a mental picture (or visualization in the intransitive sense) of the actual state of affairs In fact I think it is perfectly safe to say that the majority of radiological interpretations involve the mental picture based primarily on opaque or translucent shadows and built up by knowledge and experience to include adjacent structures which are not actually seen Not only is the word visualize correctly used it is also eminently suitable—I am etc,

Scarborough Dec 14 C BELLAMY

Applying for Hospital Posts

SIR—I am pleased that F R C S has put forward his experiences (December 11 p 1200) they tally with mine One point he does not mention is that there are too many of us F R C S.s I am pleased to see that the pass standard of the Fellowship examination has been raised to one in four Even so an extra examination is being put on this coming year to cope with the aspirants The present competition for surgical posts in London must be unique Some time back I applied for a part time registrarship at £100 per annum there were sixteen other F R C S men up for it

The points raised by F R C S as regards applications and calling when putting up for hospital jobs are only too true For one registrar post I was asked to call upon forty three persons I cried off after seeing thirteen Recently I put up for a job which necessitated calling on eighteen members of the committee It took a fortnight to arrange these interviews for a week I earned nothing myself Some hospitals ask for forty copies of one's application about £3 being spent on the off-chance of being successful For yet another appointment after calling on the medical members of the staff I appeared in due course before the lay committee of some thirty members During my attendance they were busy eating their tea and chatting hard to each other the chairman next to whom I was placed alone asked me a few questions above the din A resident of the hospital was an applicant he was destined for the post in any case If we had known this I and four other Fellowship men would have stood down and saved ourselves the farce

If only some medical members of hospital staffs knew of the rudeness of their receptionists they would shudder Certainly my secretary would get instant dismissal if I thought she treated callers as I have been treated As an offset to some of the rudeness I have encountered I cherish the memory of old-world courtesy still extended by some of one's colleagues usually the elder ones who will still personally help the applicant into his coat in their hall and show him out of the front door To such men I will turn when I recommend any patient who needs further help than mine—I am, etc,

London Dec 14 GAMMA

Women Medical Students from Cambridge

SIR,—I wish to express my appreciation of the article on the West London Hospital in your issue of December 4 It was a model of that simple clarity all articles should exhibit My present remarks are not in criticism of anything contained therein but by way of supplement

It seems a thing to be hoped for that the West London should take particular care to reverse the attitude of the other hospitals towards Cambridge women For both men and women the Cambridge training has certain advantages which may be summed up by saying that it is broader based In the case of the men this seems to be well recognized and several London hospitals have been known to give preference to Cambridge men over the men from their own medical schools The standard of education for the women is considerably higher since they must necessarily have taken an honours degree before approaching their clinical studies yet in the London hospitals they are consistently treated as interlopers, and of recent years so few places have been allotted to them that it has become a disadvantage for a woman to attempt this more exacting training It is open to the West London Hospital to do a service to medical education in general by reversing this curious bias—I am etc.,

London Dec 14 CAMBRIDGE WOMAN GRADUATE

Dental Officers in the Services

SIR—The account of the Royal Dental Hospital dinner in your issue of November 27 (p 1090) referring to the remarks made by Mr Bryan Wood president of the British Dental Association in connexion with the association's attitude towards the conditions of service of dental officers in the Royal Air Force Dental Branch might be taken to mean that the conditions of service of dental officers in the Navy and Army are regarded by us as perfect The British Dental Association does not consider that perfection has by any means been reached in the directions mentioned but it does consider that the greatest leeway exists in the case of the R.A F Dental Branch and Mr Wood's appeal was directed towards bringing that branch at least to the standard of the other Services as a preliminary to a general all round improvement being sought—I am etc.,

W G SENIOR,
Dental Secretary

British Dental Association
London W 1

noted some improvement in the advertising literature of important firms during recent years It was true, however, that the major part of the education of the profession in the use of new drugs was carried on by advertisements He hoped also that some day the use of registered names by manufacturers for the drugs they produced would be given up entirely A reprehensible practice was the use of obscure and often slightly inaccurate chemical names in the descriptive literature of some preparation, hiding the fact that it was only an old drug masquerading as a new product One of the evils of competition was the multiplication of production and research on new remedies by competing manufacturers This could not be avoided entirely where production was in the hands of private enterprise He concluded with a reference to the Therapeutic Trials Committee which was doing extremely valuable work, and of which he hoped the manufacturers would make more use A day might come when a new remedy would not be introduced until it had been passed by such a committee

General Discussion

In the course of a few comments on the president's address, Dr LEONARD COLEBROOK said that in medicine more units of the type of the one at Queen Charlotte's were needed to work out specific problems Dr E STOLKIND agreed that doctors were not critical enough of new medicines but, of course, there was no establishment in England for the control of every new preparation Dr H N GARRUS spoke of the difficulty experienced by the general practitioner in getting a real knowledge of the drugs so assiduously offered to him by advertisements and commercial travellers It was all very well to say the general practitioner was uncritical, but he was out in the wilderness He had to rely on commercial firms, and there was nobody to help him He wished the Divisions of the British Medical Association would arrange more meetings of an educational kind in this and other directions The heads of the profession did not know the difficulties in the ranks He dispensed for himself, and he had cut down his dispensary to fifteen preparations, and his practice was doing just as well on those fifteen as it had done on fifty before

Dr J H BURN considered that the medical journals were very much to blame for allowing a number of products to be advertised which simply could not stand close examination It was the lack of appreciation of the importance of the science of therapeutics for the medical student which was responsible for the present position

Dr TREVAN replied that it was not strictly true that the journals could control the situation, for the flood of advertising literature through the post would remain He hoped that the movement amongst important manufacturers for the purification of their literature would go on until a time might come when if a drug were advertised it would be accompanied by a statement such as might be expected to appear in the text columns of a scientific journal As to the control of remedies by the State, he did not think public opinion in this country was ready for it, nor would it be a good thing But the profession itself by the establishment of some sort of council might do a great deal

---

OPERATIONS FOR CHRONIC MASTOID DISEASE

At a meeting of the Section of Otology of the Royal Society of Medicine on December 3, with the president, Mr F J CLEMINSON in the chair, Mr SOMERVILLE HASTINGS opened a discussion on the choice of operation in chronic mastoid disease

The objects of operation, he said, in order of importance were to make the patient safe by reducing his liability to intracranial complications, to retain and if possible improve, the power of hearing, to rid the patient of an unpleasant and troublesome discharge, and to leave at the conclusion of operative treatment as little deformity as possible To attain these ends, and in particular the retention of hearing power, the less the middle ear was interfered with the better Experience showed that removal of the incus did but little harm to the hearing capacity, but that interference with the mucous membrane covering the round and oval windows was likely to result in considerable deterioration of hearing Moreover, the decrease in hearing capacity was not infrequently progressive, particularly in those cases in which there had been a good deal of disturbance of the middle ear during a radical mastoid When, therefore, a considerable portion of the membrana tympani could be left *in situ* to protect the mucous membrane of the inner wall of the middle ear the best results for hearing were likely to be obtained

Classification of Mastoid Operations

Mr Somerville Hastings classified the mastoid operations as follows

1 The simple or cortical operation associated with the name of Schwartze in which nothing except mastoid cells was removed

2 The conservative operation associated with the names of Küster Zampal, and Charles Heath in which the outer wall of the attic, sometimes the posterior bony wall of the meatus and occasionally the incus were removed, leaving the 'bridge, the membrana tympani and ossicles

3 Attico antrotomy or modified radical operation associated with the names of Siebenmann and Bondy in which the outer wall of the attic bridge posterior bony wall of the meatus sometimes the incus and rarely the head of the malleus were removed the membrana tympani and usually the ossicles being left *in situ*

4 The radical operation sometimes associated with the name of Stacke in which the outer wall of the attic, the posterior bony wall of the meatus the bridge membrana tympani, and ossicles were all removed

Unfortunately the nomenclature was not yet unanimously agreed on, the simple operation being sometimes described as the conservative, and the conservative sometimes as the modified radical There was a tendency to take the view that the more exactly the external auditory meatus was left at the close of operation as it had been found, the better, and, to attain this end, muscle and periosteal grafts were extensively used in all types of mastoid operation With this Mr Hastings entirely disagreed To avoid an ugly depressed scar behind the ear after a cortical mastoidectomy, a periosteal or muscle graft might have certain advantages but for all other cases a meatal flap was much to be preferred It was sometimes stated that the cavity left as the result of a meatal flap operation interfered with the power of hearing but he knew of no evidence for this statement When the simple mastoid operation could be used it gave the best all round result, it was the best operation for relatively early cases of chronic mastoid disease Where, however the greater part of the posterior bony wall of the meatus was removed and the mastoid antrum thrown into a common cavity with the meatus the conservative operation had many and great advantages over the simple mastoid particularly because the posterior wound almost always healed by first intention so that bandages could be left off within a fortnight, and the membrana tympani, aditus attic, and antrum could be dealt with readily both at operation and at any time during healing Attico antrotomy was replacing radical operation in an increasing number of cases its chief advantage being that since the middle ear was but little interfered with the hearing was in many cases unaffected and sometimes even improved The radical operation was the one that all aural surgeons did in the worst cases where there was little power of hearing and the middle ear was much disorganized it was also the operation of choice when there was a labyrinthine fistula or facial paralysis due to direct extension of inflammation As regards the Eustachian tube, he

Medical Notes in Parliament

In the House of Lords, on December 21, Viscount Dawson of Penn introduced a Bill to amend the Infanticide Act, 1922, and to provide that a woman who wilfully caused the death of her newborn child might, under certain conditions, be convicted of infanticide The Bill was read a first time The same day the Air Raid Precautions Bill was read the third time

Also in the House of Lords, on December 21, Lord Templemore introduced a Bill to consolidate the Trade Marks Acts, 1905 and 1919, and the Trade Marks (Amendment) Act, 1937

The House of Commons adjourned for Christmas on December 23 after making progress with the Coal Bill and Unemployment Insurance Bill Debates were arranged upon foreign affairs and the cost of living The House of Lords also adjourned after further discussing the Air Raid Precautions Bill

The Report of the Department of Scientific and Industrial Research for 1936–7 was laid on the table of the House of Commons on December 20 The annual reports of the Radium Trust and the Radium Commission were published on December 17 (see p 1290)

The House of Commons will reassemble on February 1, and the Government expects to introduce early that month the Rent Restriction Bill and the Housing (Continuation of Subsidies) Bill Subsidies will be maintained at the present rate from March to December, 1938 The introduction of the Milk Bill is unlikely before Easter, as the present Milk (Amendment) Act continues in operation until September, 1938

The House of Commons will go into committee on the Population (Statistics) Bill soon after its reassembly

The reports of the Interdepartmental Committee on the Rent Restriction Acts were issued on December 20 Sir Francis Fremantle was a member of this committee

During the discussion of the Coal Bill in committee in the House of Commons on December 21 the question arose of the allocation of any surplus revenues of the Coal Commission Mr Oliver Stanley said that the question of safety in mines was one which should be left to the decision of the Royal Commission which was considering the matter The Secretary for Mines had power to make contributions for research work Research was proceeding with regard to silicosis, and he had not heard that it had been in any way hampered or delayed because there was insufficient money available

Medical Officers of Health in Private Practice

Lord MERTHYR, in the House of Lords on December 15 asked how many county councils in England and Wales had failed to formulate arrangements for securing that medical officers of health should not engage in private practice as medical practitioners He said that the Local Government Act 1929 Section 58 contained a mandate to county councils to formulate schemes under which medical officers of health in county districts should not be able to engage in private practice Power was also given in that Act to the Minister of Health in default of the county councils doing this work enabling him after six months notice to do it himself That mandate and those powers were renewed in Section III of the Local Government Act 1933 In December 1936, nearly seven years after the Act came into force twenty seven out of sixty-one county councils had not formulated these arrangements A year ago it had been said that the principal cause of delay was that the review of county districts under the 1929 Act had not been completed that review had now been completed with one possible exception A year ago the Government spokesman mentioned that only three counties appeared to have failed to take any steps at all to comply with the Act What had been done by the Ministry in those three counties? Lord Merthyr said he knew that temporary appointments of medical officers of health on a part time basis were still being made In one appointment made since last year the medical officer of an urban district received the salary of £10 He was not a permanent official Why was Parliament always asked to pass fresh public health legislation if existing legislation was not in force? Why did Parliament spend so much in building sanatoria for curing disease if it could not afford a few thousands for the appointment of full-time medical officers which might prevent the disease?

The EARL OF LISTOWEL said it was clearly harmful that a medical officer of health should have to divide his time between his private practice and his duties towards the local authority

GOVERNMENT REPLY

VISCOUNT GAGE replying for the Ministry of Health, said the Minister had no power to compel the local authority to adopt the scheme that he made He could make a scheme, but if the authority did not like it, all the Minister could do under the Act was to insist that the authority should not engage any more part-time medical officers There were practical limitations in the procedure which the Act laid down In some places the part time medical officers had not completed the period for which they were engaged to serve under contract A scheme prepared long before these contracts ended might be out of date before the contracts fell in He agreed that whole time medical officers should be the rule, and he welcomed the debate, but suggested that the default powers ought to be used with judgement He was prepared to give Lord Merthyr any information he required but he asked the House to judge the statistics in the light of the difficulties which the Minister had to face Under the Act sixty one counties had to formulate these arrangements, thirty-nine had done so One was on the point of completing arrangements, and in another the Minister had used his powers and formulated a scheme himself In one the county review under the Acts of 1929 was not yet completed in two arrangements had just been completed In two more counties the populations were so small that arrangements had to be made with neighbouring counties, and these arrangements in turn had been held up In all the remaining cases except four the Minister was satisfied that a scheme in some degree was under consideration There were two cases in which the Minister felt that the arrangements he expected to be ready last year required further consideration, and in two he had started default procedure In the county in which Lord Merthyr was interested default procedure was started but was suspended temporarily

Lord MERTHYR said Viscount Gage had presented an unsatisfactory case

Conditions in the Nursing Service

Miss Musson chairman of the General Nursing Council, was the invited speaker at a meeting of the Conservative Health and Housing Committee at the House of Commons on December 15 She dealt with present conditions in the nursing service, and with the difficulty of securing sufficient recruits for the increasing requirements of hospitals, clinics, and private practice She said much was being done to increase the attractions of a nursing career by the provision of comfortable residential quarters, shorter hours of employment and better pay But there could be no assurance of an adequate number of entrants for the total requirements of the whole country until the prospects of the profession in the matter of pay pensions, and promotion encouraged parents and head mistresses to recommend nursing as an attractive career for young women of superior education All this would mean increased expenditure for voluntary and municipal hospitals Miss Musson rejected sensational stories of the hardships of hospital life, and asserted that even in present circumstances the right type of girl found nursing a congenial occupation

Experiments on Animals—A list showing the number and character of experiments performed by the respective licence-holders under the Statute 39 and 40 Vict c 77, was omitted from the annual return of experiments on animals for reasons of economy and Sir Samuel Hoare declared on December 16

was as a rule accustomed to curette it but had to admit that in some cases his curettage had not secured the desired result, and the tube had remained open

A Pooling of Views and Experience

Mr GAVIN YOUNG (Glasgow) said that the principal motive in operating in chronic mastoid disease was the removal of the potential danger to the patient's life, secondary only to this was the deterioration progressive even if slow, in hearing and the operation was undertaken to prevent further deterioration, sometimes happily with improvement in the hearing Other reasons for operating might be ear discharge the incidence of facial paralysis in a chronic case, or the existence of vertigo He confined his surgical procedures to two types of operation—the radical and the anomalously named modified radical, by the latter he meant the technique by which the mastoid cavity was exenterated, the bridge very carefully broken down the last part of the breaking down being done from within the aditus outwards by a sharp spoon, and the posterior part of the external attic wall being removed, the utmost care being taken to preserve intact all the normal intratympanic structures The main factor in deciding upon which of the two types of operation was to be used was the patient's hearing, and not merely the hearing in the affected ear but also the state of the other ear Every case should be examined radiographically before operation though often one learned little from this and he would be glad to know of any means of differentiating radiographically between cholesteatoma and sclerosis In his experience the hearing was not often deteriorated by the radical operation, and quite commonly was improved

Mr WALTER HOWARTH observed that, different surgeons called the same operation by different names, and asked whether an agreement could not be come to regarding nomenclature Mr L GRAHAM BROWN said that he carried out three types of mastoid operation (1) simple mastoidectomy (Schwartze) (2) conservative transmastoid antroatticotomy and (3) radical or transmastoid antro-atticotympanotomy, which was not often done Post-operative treatment was very important and he had found the use of eusol three hourly with Southey's tubes very satisfactory Mr A J WRIGHT (Bristol) believed that the tympanum had very great powers of recovery and should be handled very gently He thought it a mistake to try to obliterate the cavities which should rather be drained and ventilated Often he thought that the wrong part of the body received attention and attention to the other end of the Eustachian tube and especially the mouth and teeth was important Mr T B LAYTON said that the radical mastoid operation should not be done for merely potential risk to life this particularly applied to children whose hearing and wage-earning capacity were impaired by the radical mastoid He did not like doing a meatal flap

Mr A G WELLS had had experience of 2,000 mastoid operations in children He had used muscle grafts and skin grafts and his muscle graft results were very mixed indeed many of them required reopening while he found skin grafting generally successful He had most success with the conservative mastoid operation with meatal flap mainly the Heath type but only when he himself carried out the after treatment Mr F W WATKYN THOMAS said that his own experience of a flapless operation was discouraging In children he had never done a radical mastoid operation in the past ten years except in suppurative labyrinthitis He always left the Eustachian tube alone Mr M VLASTO agreed with Mr Layton in disliking the meatal flap He had recently noticed that Baldenweck and others on the Continent had been using ozone in the after treatment of mastoid operations with much success Mr THACKER-NEVILLE (Harrogate) practically never did a radical mastoid operation and had found the muscle graft a good thing Mr G EWART MARTIN (Edinburgh) observed that it used to be said that they did too many radical mastoid operations in Edinburgh, but if there were a chronic suppurative otitis media, the attic and aditus being involved and the upper part of the mastoid and the rest of the cells sclerosed, some type of radical operation was required He agreed that the nomenclature needed clearing up Post-operative treatment was the essential in the success of the operation

Mr E L BURNIER (Margate) discussed post-operative treatment since he had been using skin grafts and packing with gauze he had had little difficulty with radical mastoid operations five days after operation the gauze was removed and no further treatment was employed except swabbing and powdering Mr W STEWART (Southampton) said that he never performed the complete radical mastoid operation, but employed only the simple and the modified radical He cut a flap and packed with gauze soaked in iodoform emulsion he removed this in three days under gas and did not look at the wound again for a fortnight Mr T B JOBSON (Guildford) reminded members that zinc ionization would get many cavities dry which continued to discharge after operation

INVESTIGATION OF GASTRIC DISEASES

At a meeting of the Medical Society of London on December 13, Mr J E H ROBERTS presiding, a discussion took place on modern methods of investigating gastric diseases

Mr H W RODGERS who exhibited a modification of the Wolf Schindler gastroscope said that diagnosis of gastric conditions should be directed first to the anatomical lesion, secondly, to the psychological lesion and thirdly, to the constitutional type to which the patient belonged The anatomical lesion was so difficult that as a rule it exhausted all the clinical skill available The anatomical diagnosis again fell into three stages the exclusion of any extra abdominal disease which might be causing the symptoms the exclusion of any intra abdominal but extra gastric disease which equally might be causing the symptoms, and finally, the determination of the gastric lesion

The means at disposal were the history, clinical examination the occult blood test the analysis of the gastric juice skin tests x rays, and gastroscopy The occult blood test was of established value especially to the general practitioner For routine use in general practice and in hospital, where it appeared to be impossible to examine radiologically all cases of dyspepsia the test might be used to decide which of the many suspected cases of ulcer and carcinoma should be x-rayed Analysis of gastric juice gave little help in primary diagnosis of anatomical lesions A small number of cases of severe dyspepsia were due to allergic manifestations, and these might be investigated by skin tests and by keeping a record of the daily dietary

The Place of Gastroscopy

Radiology should always precede gastroscopy These two investigations were complementary, the one giving information that the other failed to give Bad radiology was the best indication for good gastroscopy Mr Rodgers discussed the technique of gastroscopy, and showed a number of coloured drawings illustrating the appearances of the mucosa as shown by the gastroscope The diagnosis of gastritis was gastroscopy's most important function If all cases of dyspepsia with a negative x ray examination and in which the indigestion was not obviously related to an early extra gastric disease were examined by the gastroscope probably 30 per cent of them would show some degree of active gastritis Gastroscopy also might be the only method of diagnosing small ulcers. In following the healing of an ulcer gastroscopy was a very reliable guide The gastrojejunal ulcer was notoriously difficult to diagnose by x rays, and although

that the cost of reinstating it would not be justified He added that the Home Office did not keep records of the number of experiments performed on different classes of animals

Employed Persons and Hours of Out patient Departments—Mr HARVEY asked on December 16 whether the attention of the Minister of Health had been called to the hardship caused to a large number of employed persons by the fact that the out patient departments of hospitals were usually only open during the hours when they were employed in daily work and whether he would encourage the provision of facilities for such out patients to be received at an alternative time Sir KINGSLEY WOOD answered that in the case of voluntary hospitals he had no jurisdiction So far as hospitals provided by local authorities were concerned he would make inquiries if Mr Harvey furnished particulars

Detention in Hospital of Disease Carriers—Mr KELLY asked how many carriers had been detained in London hospitals since December last of what diseases were they said to be carriers how were these carriers diagnosed under what legal regulations were they detained in hospital whether they were isolated or mixed with other patients and who decided how long they were to stay in hospital Sir KINGSLEY WOOD answered on December 17 that carriers were not admitted to the London County Council's infectious diseases hospitals the only cases admitted being persons suffering from such diseases Patients who had ceased to show any clinical symptoms or physical signs of disease might however be retained if the medical superintendent considered that they were still in an infective condition It was customary to separate such convalescents from the acute cases No figures were available as to the number of patients so retained since last December or of the diseases from which they suffered

Notes in Brief

Sir SAMUEL HOARE will publish early in the New Year a guide to the new Factories Act which will include some information as to the duties of local authorities He proposes later to send them a fuller memorandum on the subject So far as regulations are concerned he does not anticipate any early change which would substantially affect the volume or organization of the work of these authorities

Universities and Colleges

UNIVERSITY OF OXFORD

At a congregation held on December 11 the following medical degrees were conferred

D M—L H Koerner H J B Atkins J K Marshall N E R Archer

B M—F J Ingham J E Lovelock L B Bok S E Furber D G W Clyne H G Owen Smith D Whitteridge J A Trimbridge H J L Dickenson R C Browne C I Murphie D A. Ireland H Muller N F Stidolph P de B Turtle

UNIVERSITY OF LONDON

The University of London Graduates Association has nominated Mr Philip H Mitchiner M D M S., F R C S for election to the Senate of the University of London as a representative of registered graduates in medicine of Convocation As there is no other nomination no voting papers will be issued and Mr Mitchiner will be returned unopposed

UNIVERSITY OF LIVERPOOL

The following candidates have been approved at the examinations indicated

M D—A G Leech A J McCall W N M Mason M H Pennington T Scott

gastroscopy went much further it had by no means solved the problem If 'the ulcer was just out of view a localized area of gastritis or jejunitis might be like a sentinel betraying the position of the enemy The difficulty was that in the majority of cases only the gastric side of the anastomosis was visible, and in one-third of the cases part or all of this was hidden Polyps were more often diagnosed by gastroscopy than by x rays Five of the six polyps he had seen had been found in atrophic mucosa In the diagnosis of carcinoma the gastroscope played a small but important part, for it should diagnose the smaller lesions, having a good prognosis, which *x* rays had overlooked

Left with a patient who had proved negative to all these tests, one was apt to put the condition down to nervous dyspepsia and treat him with unkindness ' The psychology of dyspepsia should be carefully taken into account The influence of mind on the stomach had often been demonstrated, and there was evidence that people of certain psychological types might by their mental activity produce some kind of gastric discomfort Diagnosis of the psychological lesion was as necessary as diagnosis of the organic

Radiological Technique

Dr G T CALTHROP demonstrated some radiological methods in the diagnosis of gastric disease, in particular the elaborate method of H H Berg for the systematic x-ray study of the mucosa of the stomach and duodenum by the barium meal These methods in principle were not new, and in this country Gilbert Scott had for years advocated what he called whitewashing the walls of the stomach The speaker drew special attention, in discussing x-ray appearances, to the mucosal folds, which had direction width, and consistency The consistency must be examined by palpation In gastritis the first signs were those of change of direction and coarsening of the folds, but not every case of broadening of the folds should be called gastritis If there was normal mucosal relief up to the base of an ulcer it was unlikely that carcinomatous changes had occurred The duodenal cap was always under suspicion until proved not guilty If the patient was rotated into the right anterior oblique position and the optimum projection was made so that the cap was placed away from the small intestine and as much away from the spine as possible, one should get the mucosal relief In duodenitis, as in gastritis, the folds would be coarsened, thickened, and distorted, and in duodenitis one had often to rely on tenderness and irregularity of outline of the cap Berg s methods, Dr Calthrop added, were simply a forward step in the ordinary routine examination by the barium meal They had not made *x*-ray examination easier but more laborious and the interpretation more difficult, but in that they afforded more direct evidence of disease they were of value

Choice of Methods

Dr S COCHRANE SHANKS said that it was conclusively proved that gastroscopy was of great value in some cases Visual inspection, after all, occupied a place second to none in the clinical examination of the sick, and every extension of it was welcome There was equally no doubt that the barium meal was easier to swallow than the gastroscope, and for that reason alone the *x*-ray method would take priority The gastroscope would help in certain cases such as malignant degeneration of a small ulcer From a radiological point of view, to accept Hurst s statement that pre pyloric ulcer was prone to malignant hyperplasia was to err on the safe side, because it kept one wary The malignant ulcer was supposed to be a large one, but such ulcers 2 inches in diameter had been seen The therapeutic test was a very difficult point if the ulcer was simple all was well, but if it was malignant a vital three or four weeks had been lost Again, what of certain simple ulcers which at first showed regression, and so ' led one up the garden path ? Radiology could give no answer in many of these cases Could gastroscopy help? One large field for gastroscopy was in gastritis As for jejunal ulcer, if radiology could not show the ulcer it could show the jejunitis which was its precursor, and, after all, the ulcer was only an incident in a disease process While tribute should be paid to Berg for his barium meal technique, it should not be withheld from earlier workers, such as Béclère in France and Barclay and Gilbert Scott in this country, who had applied the principles long ago, though they had not brought out so systematized a technique

Another important lesion was carcinoma of the cardia Both the erect and supine views should be taken In the early case all that might be seen was delay in the passage of the meal through the cardia followed by a little spurt In the developed case a number of signs might be present The tumour, if there was one, might be seen outlined against the gas bubble There might be some dilatation of the lower oesophagus, a lengthened sphincteric canal, fixation of the cardia if the growth was binding it down, and a forking of the barium stream over the tumour Dr Shanks added a few words about gastric fistulae The barium enema was the most certain method of showing the types commonly seen in the radiological department, but it was desirable to use both enema and meal, since the meal might give information that the enema could not furnish

Indications for Gastroscopy

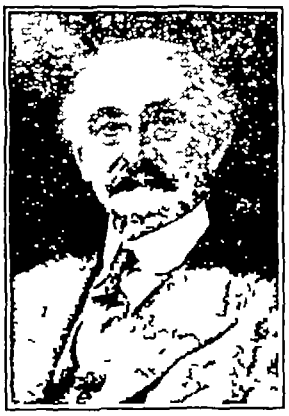
Dr R S AITKEN said that during the last year he had examined about 100 stomachs with the gastroscope In a handful of these cases his findings contributed something of use to the diagnosis They had all, of course, been examined by x rays, and the vast majority had been adequately diagnosed beforehand, but in one or two cases the gastroscope discovered an ulcer which the radiologist had failed to find In carcinomata he had one case, a middle-aged woman, in which the radiologist had failed to find any abnormality in the stomach, but the gastroscope—which did not go in very well and with which he was able to see only part of the upper half of the stomach—showed an obviously irregular lumping of the mucosa, which did not distend with air in the fashion it should have done and which bled copiously He felt strongly suspicious that it was malignant, and a month later another *x*-ray examination confirmed this finding On the other hand, there had been one case in which the history was somewhat suggestive of carcinoma of the stomach, and the radiologist found an irregularity of obscure origin, but gastroscopy showed quite clearly that the irregularity was due to a healed ulcer Some patients were very unhappy during gastroscopic examination, but others tolerated it well, and a number had cheerfully submitted to a second or third examination

Mr HERMON TAYLOR showed a modification of the Schindler gastroscope which permitted of a sideways movement He also showed and described a series of drawings of the appearances seen in gastroscopy He suggested that the wall of the normal stomach was glassy smooth with clear-cut narrow rugae

Mr HAROLD EDWARDS said that gastroscopy had gone through a period of three years probation in this country and had now become an established procedure In research he thought it had a distinct place, but he deprecated any unilateral kind of research with the gastroscope, it should be combined with other methods The indications for gastroscopy in clinical work were (1) cases suspected of gastric lesion and in which the x-ray result was negative, (2) cases in which a lesion was shown by x rays but its nature was not revealed, (3) cases which developed symptoms after operation, (4) to follow healing

Gastric Test Meals

Mr E J KING of the British Postgraduate Medical School described the type of test meal used there It was



Obituary

G H F NUTTALL M D, F R S

Emeritus Professor of Biology University of Cambridge

The sudden death of Professor G H F Nuttall at the age of 75 has deprived the world of one of its most remarkable scientific workers

George Henry Falkiner Nuttall, the son of a doctor practising in San Francisco, was born there on July 5, 1862 In 1884 he obtained the degree of M D of the University of California, and his first training in biological research he received in the Johns Hopkins University From 1886 to 1890 he studied in Gottingen, where he obtained the degree of Ph D On his return to Baltimore in 1890 he became assistant to the late Professor Welch and later Associate in Hygiene In 1893 he returned to Germany and joined the Hygienic Institute of Berlin, where he acted as honorary assistant to Professor Rubner In 1895 he married Paula, daughter of Kammerherr von Oertzen-Kittendorf and in 1899 went to Cambridge to teach bacteriology and preventive medicine He received the honorary M A degree and was elected a Fellow of Christ's College in 1905 he became Reader in Hygiene The same year he was appointed to the Quick Professorship of Biology and was elected a professorial Fellow of Magdalene College

Temporary accommodation was found for him and his co workers in an unfinished room of the medical museum In this room, which became known as the Quick Laboratory, much valuable research was carried out until 1920 In 1919 a generous gift of the late Mr and Mrs P A Molteno provided the funds for the erection of the Molteno Institute for Research in Parasitology

Many honours were bestowed upon Nuttall, both at home and abroad In 1904 he was elected Fellow of the Royal Society He received honorary degrees from various universities, and was elected corresponding member of many scientific societies He received also the Belgian Order of Leopold II and the French Order of Commandeur de la Légion d Honneur

His research, incorporated in over 200 published papers and books covers several branches of biology, such as bacteriology, serology hygiene tropical medicine, and parasitology His most important discovery was the demonstration of the bactericidal properties of blood serum and other body fluids This investigation, which has led to the discovery of antitoxic sera, is unanimously recognized as pioneer work in immunology Between 1901 and 1904 he was actively engaged in the study of the precipitin test for blood By an extensive investigation of this reaction with 600 blood specimens he established a general law that a similarity in chemical constitution of the blood exists in animals which are related phylogenetically and that this similarity is greatest in animals the most closely related The results of this work naturally had also great application in forensic medicine

In collaboration with Thierfelder (1895–7) he performed the first successful experiments on life under sterile conditions In this investigation guinea-pigs delivered by Caesarean section under aseptic conditions were kept alive and fed for two weeks in a specially devised chamber, where they grew under bacteria-free conditions This experiment solved the problem which had preoccupied Pasteur and his pupils It also solved the biochemical problems concerning the origin of some substances in the gut and urine of mammals In collaboration with Welch (1892) he discovered and studied the first case of pathogenic gas-producing micro-organism This was the starting-point of much important work carried out during and after the war

His work on mosquitos opens with the first precise distribution map of *Anopheles maculipennis* in England and with the discovery that its distribution coincides with the past and present distribution of ague in England This work was followed by a very extensive investigation of the biology and anatomy of *Anopheles maculipennis* carried out in collaboration with the late Sir Arthur Shipley He then turned his attention to the study of canine piroplasmosis, which represents the first case of investigation in Europe of a disease imported by means of an infected vector—the tick from South Africa One of the results of this investigation was the discovery of the curative property of trypan blue, and this discovery has had great economic importance This study was followed by an extensive investigation of the anatomy biology, life history, and systematics of ticks carried out in collaboration with Mr C Warburton, Dr L E Robinson, and others The results of this investigation were incorporated in a series of papers and monographs Most of his time during the war was devoted to the study of lice (*Pediculus*), their life history, biology and anatomy and the problems connected with methods of combating the spread of these parasites

The wide influence which Nuttall acquired in scientific circles here and abroad was not only due to his important scientific achievements but also to the *Journal of Hygiene* and *Parasitology* the two important journals founded by him and edited for many years He was greatly interested in medical education and, although he was not what may be called a brilliant lecturer, his lectures had the peculiar attraction of always conveying first-hand knowledge He was, however, at his best after the lecture in conversation with his students Then only, free from all the inhibitions of a formal lecture, he would tell them with his natural enthusiasm of his personal experiences and that of other workers who were in direct touch with him

Nuttall had a great charm of manner, never shown better than at the daily tea-time gatherings in the laboratory Visitors there, scientific or lay, were placed at once at their ease in the presence of a vivacious conversationalist A great traveller and accomplished linguist each of his many trips abroad was prepared for with much of that meticulous care which he bestowed on his scientific papers An accomplished draughtsman, his interest in art extended to its higher forms—an interest which he was able to indulge by visits to the famous galleries of the world The knowledge so gained was always at the disposal of his friends It may have been that his boundless enthusiasm hastened his death, but he died as he always hoped to die—free from the disabilities and sufferings of a lingering illness and that melancholy sometimes associated with old age His wife died in 1922, he is survived by two sons and one daughter

BRITISH MEDICAL JOURNAL

LONDON SATURDAY OCTOBER 9 1937

THE HAEMORRHAGIC STATES*

BY

L. J WITTS, M D., F R C P

Professor of Medicine University of London Director of the Medical Unit St Bartholomew's Hospital

I feel considerable diffidence in opening a discussion on the haemorrhagic states It is a subject on which there has already been too much writing and talking and too little experiment Moreover the time is not ripe for a schematic presentation such as we can employ in discussing the anaemias Here we are not dealing with a single-cell system, but with the complex and interlocking mechanism of haemostasis in which the plasma the platelets, the endothelial lining of the vessels and the connective tissues all participate It is convenient to distinguish between haemophilia and related conditions in which the blood does not clot normally and purpura or haemogenia in which the blood clots with normal speed but the bleeding time is prolonged Even this distinction is not absolute for there are conditions such as melaena neonatorum which combine the features of haemophilia and haemogenia a defect in the plasma may not only affect the coagulation of the blood but also interfere with the agglutination of the platelets and the opsonization of the endothelium so giving rise to phenomena more characteristic of purpura And in some haemorrhagic states especially those due to inherited fault, the usual clinical and laboratory tests for a haemorrhagic tendency may be negative in the face of a manifest tendency to bleed excessively For the purpuras I propose to follow the classification recently given by Davidson (1937) into idiopathic or symptomatic as regards their aetiology and thrombocytopenic or non thrombocytopenic as regards their morphology Let us agree that platelet and vessel wall are both concerned in purpura haemorrhagica and eschew controversy on their relative significance I wish to treat the haemorrhagic states pragmatically and to isolate certain elements in a purely observational and empirical way hoping thus to simplify the underlying complexity

Hereditary Haemorrhagic States

I am increasingly impressed by the frequency and diversity of hereditary haemorrhagic diseases and by their resistance to treatment The study of hereditary diseases in man has been vitiated by premature dogmatism and by the expectation of a constancy in the mode of inheritance which the student of genetics in plants and animals would from the first have thought improbable Hereditary haemorrhagic states in man are not subject to immutable laws in pattern and pedigree and it is wiser to think in terms of affected family groups than of specific diseases and laws of heredity The hereditary haemorrhagic diseases provide some of the most pathetic cases we see and it is natural that we should strive to do everything possible to relieve them Nevertheless their suffering is not lightened by the publication of methods of treatment which time proves to have no curative value The local application of coagulant snake venoms is the only new treatment whose value has been confirmed The venom of Russell's viper (1 in 10 000 solution) or of the Australian tiger snake (1 in 5 000 solution) has been chiefly used (Macfarlane and Barnett 1934 Rosenfeld and Lenke, 1935) Loose clot is washed away from the bleeding point, and tampons or other appropriate dressings soaked in the venom solution are then applied With the use of snake venom in haemophilia it is now possible to repair wounds or to carry out small operations such as dental extraction which would previously have been fatal

Other new treatments have already passed into the limbo of discarded things or show signs of passing there as they have not lived up to the claims made for them Any curative action of liver or oestrin in haemorrhagic states has by now been abundantly disproved It will be interesting to hear the results of trials of the Sheffield treatment of haemophilia with an extract of egg albumen (Timperley *et al* 1936) Dr R G Macfarlane and I have had no success whatsoever in four haemophiliacs treated by this method Injections of moccasin snake venom have been recommended for all forms of chronic and recurrent bleeding especially those of a purpuric type (Peck *et al* 1935 1936) It is difficult to test a remedy which admittedly makes no difference to the platelets the coagulation time or the bleeding time In three cases of hereditary thrombasthenia I have had no success with treatment with moccasin snake venom and Davidson (1937) records a similar lack of success with this treatment in idiopathic thrombocytopenic purpura Moccasin snake venom is reported to be more successful in hereditary telangiectasia and in one case of this disease where I advised its employment there was a temporary remission of symptoms but it was soon followed by relapse in spite of continuing treatment. Eugenists may derive a melancholy satisfaction from this catalogue of failures in the treatment of the hereditary haemorrhagic states and there is no doubt that prevention will always be better than cure All the same work at present being carried out in Holland (Bendien and van Creveld 1935 1936 1937) and America (Pate and Stetson 1936 Pitch and Taylor 1937) suggests that a curative treatment for haemophilia may not for ever elude our grasp

The Platelets and the Spleen

Idiopathic thrombocytopenic purpura stands out more clearly now that we have been able to detach from it the hereditary purpuras the allergic thrombocytopenic

* Read in opening a discussion [illegible] of the Sections of Medicine and Pathology and Bacteriology and the [illegible] the Annual Meeting of the British Medical Association Bristol 1937

purpuras due to sensitivity to foods and drugs, and the symptomatic thrombocytopenic purpuras due to destruction of the foci of platelet production in the marrow by organic and inorganic poisons There are no gross changes in the spleen in idiopathic thrombocytopenic purpura, apart from simple hyperplasia and the only abnormalities in the marrow are some increase in number and decrease in maturity of the megakaryocytes We still do not know whether the disease is due to a diminished production or an increased destruction of the platelets The dramatic results of splenectomy are somewhat discounted by the discovery that within an interval of months or years about half the patients relapse, though as a rule symptoms are much less troublesome than before the operation (Pemberton, 1934 , Williamson, 1934) This discovery suggests that splenectomy is not a cure for idiopathic thrombocytopenic purpura in the same sense as it is a cure for acholuric jaundice Remissions of thrombocytopenic purpura after splenectomy, like remissions of pernicious anaemia following this operation, are apparently due to "the lifting of a mysterious restraint which the spleen exercises upon the delivery of immature blood cells by the marrow" (Cornell, 1927), and do not signify any fundamental change in the underlying disease process In making these reflections on splenectomy—for I do not call them criticisms—I am mindful of the fact that medical treatment is purely symptomatic and its results inferior to those of surgery (Brown and Elliott, 1936) It is true that there has recently been a revival of interest in treatment by x rays (Mettier and Stone, 1936 , Rudisill, 1936), but I should like to hear comments on its value, for it is my impression that x-ray failures have not received the same publicity as x-ray successes

The mortality of splenectomy in acute attacks of idiopathic thrombocytopenic purpura has been greatly reduced by the practice of repeated or massive transfusions, but in view of the frequency of spontaneous recovery, the difficulty of diagnosis from infectious and malignant purpuras, and the inability to promise complete security from relapse, I should like to ask how long we should persevere with medical treatment before asking the surgeon s help My present opinion is that medical treatment should be tried for seven to ten days In chronic cases the operative mortality is small, but I should advise restricting splenectomy to patients in whom the disease is really disabling or is subject to acute exacerbations There are two other matters connected with splenectomy on which I should like to hear people s experiences The first is the value of tests with adrenaline or protein shock before splenectomy Does an increase of platelets in the blood after either of these agents indicate that the operation is likely to be successful, and is the reverse also true? The second question is, How often is relapse due to the growth of a spleniculus? I know that this phenomenon has been described, but when we compare the frequency of relapse in idiopathic thrombocytopenic purpura with its rarity in acholuric jaundice we must doubt whether growth of a spleniculus is a common explanation of relapse, and certainly I should hesitate to advise a second operation

Vitamin C

The outstanding event of the last decade in the haemorrhagic diseases has been the isolation and synthesis of vitamin C or ascorbic acid It can now so easily be administered in large doses by mouth or by injection that it has been tried in many diseases, and there has been a spate of papers comparable with those which followed the introduction of insulin and liver extract, suggesting that ascorbic acid is a panacea for all kinds of haemorrhagic states and extending its range of usefulness even to dropsy and leukaemia It is fortunate that at the same time methods have been devised for the estimation of vitamin C in the body fluids, and the test of the resistance of the capillaries has been put on a quantitative basis It has been shown that while overt scurvy is rare in civilized countries subclinical scurvy is not uncommon, especially in patients who are febrile or who take special diets Vitamin C cures scurvy rapidly and dramatically, but it has no action on haemophilia, thrombocytopenic purpura, Henoch Schonlein purpura, leukaemia, or other non-scorbutic haemorrhagic states It may be that patients with these diseases sometimes suffer in addition from subclinical scurvy, and that the removal of this disability may make all the difference to the appearance of symptoms Unfortunately this has not been my experience, and I have given massive doses of vitamin C by the mouth and by the veins in these diseases without benefit

Mrs W, aged 29 had had symptoms of idiopathic thrombocytopenic purpura for at least two months Her excretion of vitamin C in the urine was normal (26 mg daily), and she excreted 729 mg out of an intravenous test dose of 1,000 mg. of ascorbic acid suggesting that her tissues were well filled with the vitamin She was treated for a week with ascorbic acid 300 mg intravenously every day , but she had menorrhagia, and her haemoglobin level fell from 65 to 50 per cent. She was then submitted to splenectomy, and her symptoms were much improved Her platelets remained low throughout, never rising above 40 000 per c mm

Miss C, aged 32, had a relapse of symptoms of idiopathic thrombocytopenic purpura twelve months after splenectomy Less than the normal amount of vitamin C was present in the urine (12 to 24 mg. a day) and only a small fraction of a test dose of 600 mg of ascorbic acid by mouth was excreted She was treated for sixteen days with a high vitamin C diet plus 300 c cm of orange juice daily, but there was no change in the bleeding tendency or in the number of platelets, which fluctuated about 10,000 per c mm

Norman T , aged 15, who suffered from hereditary thrombocytopenic purpura, had a low urinary excretion of ascorbic acid (6 6 mg a day) and required approximately 2 000 mg. of ascorbic acid to attain normal excretion He was treated with daily intravenous injections, receiving 4,500 mg in thirteen days without change in the haemorrhagic tendency or in the number of platelets, which remained about 30 000 per c mm.

Miss A aged 36 who suffered from non thrombocytopenic purpura of many years duration, associated with splenomegaly and chronic infection of the parotid glands, had a high output of ascorbic acid in the urine (47 mg daily) As might have been expected, intravenous injections of ascorbic acid in amounts varying from 300 to 900 mg daily had no effect on the purpura

William B , aged 15 suffered from a hereditary haemorrhagic diathesis—probably thrombasthenia His excretion of vitamin C in the urine was low (15 mg daily) After taking 400 mg of ascorbic acid a day by mouth for three days he still excreted only 143 mg in twenty-four hours, so his tissues must have been deficient in vitamin C He was then treated with a high vitamin C diet and orange juice 300 c cm daily, but the experiment was discontinued after five days, as he had a slight fall and sustained excessive bruising of the face and eye

I have treated three cases of chronic ulcerative colitis with massive doses of vitamin C, by mouth and parenterally, without affecting the number or composition of the evacuations or the condition of the patient , and three cases of acute leukaemia without affecting the haemorrhagic tendency, the oral lesions, the blood picture or the fatal termination I therefore feel justified in concluding that vitamin C, by mouth or parenterally, is of no value as a general or non specific remedy for haemorrhagic states In purpura haemorrhagica

Professor Major Greenwood F.R.S., writes

As a friend of more than twenty five years standing I am strongly tempted to speak of Nuttall as a man but his personality was so sympathetically described by the writer of the notice in the *Times* of December 18 that I feel I can add nothing at most this Nuttall loved *Cambridge with that deep affection a man of English* ancestry bred in a foreign country so often feels for our ancient universities Perhaps to those who have lived from boyhood in Oxford or Cambridge old picturesque usages and customs lose their charm become mere matters of course That never happened to Nuttall He had dreamed of a university city spreading her gardens to the moonlight and whispering from her towers the last enchantments of the Middle Age so often before he came to one he was welcomed there so kindly, that the spell was never broken He was a happy man

Perhaps I may pay tribute to Nuttall as an editor He did much to raise the standard of literary workmanship in medical and biological circles Many years ago I read a paper *not* in the *Journal of Hygiene* containing a long list of references to other papers published in German Having some reason to doubt whether the writer knew German well I made some remark to him on the labour he must have had He replied with a smile that he had had no trouble but simply copied the references from somebody else's paper I do not know that petty thefts of this kind never occur now but I do know that if Nuttall detected a contributor in this kind of dishonesty there was bad trouble for the contributor Not only did Nuttall require honesty, he required intelligibility Years ago when Pflüger still edited his *Archiv* the cover had an editorial notice somewhat to this effect The Editor cannot undertake to correct grammatical errors in articles offered by foreigners articles written in grammatically correct German are often almost unintelligible Nuttall had more courage than even Pflüger and the only time I can recall an editorial display of anger was in connexion with a paper written in bad English It was *offered* by a foreigner Nuttall and I rewrote it It was already in pages when we discovered that the author had published the same paper (but not in English) elsewhere Nuttall could not reduce the Press to fury by cancelling the paper but he did print an editorial footnote the acerbity of which would not have shamed those famous editorial initials K P While he insisted on intelligibility and disliked slang he was no pedant I think he shared my hatred of using easy and patient as synonyms and permitted me to delete "markedly and very markedly" but he agreed with Horace *dabiturque licentia sumpta pudenter* and interpreted *pudenter* with generosity Perhaps these are small things and his editorial skill in greater things will be praised by others with more technical knowledge But I think literary honesty and to take pains in writing are not small things Nuttall set a high standard he was a great editor and a great gentleman That was why we loved him

[We are grateful to Mr. Russell Hendon]

The following well known foreign medical men have recently died Dr Pedro Cid Professor of clinical surgery in Buenos Aires Professor Peter Dethleffsen Professor of Danish descent and 82 D Ludwig Frank professor of gynæcology at Jena and a specialist in [illegible] Professor Paul Wallich of Wiesbaden [illegible] at Graz

Medical News

Up to the time of going to press the number of known or suspected cases of typhoid fever in the present outbreak at Croydon was 285 with 26 deaths

In our advertisement columns this week applications are invited for the following posts in the University of London the University Chair of Surgery tenable at University College Hospital Medical School, in the University of Wales, the David Davies Professorship of Tuberculosis and in the University of Liverpool, the George Holt Chair of Pathology

After January 1 1938 the Editor of *Brain* will be Dr F M R Walshe 56 Portland Place London W 1, to whom exchange journals and books for review should be sent

The *Manchester Guardian* states that the Manchester Public Health Committee has decided to arrange that no member of its nursing staffs shall be on duty for more than ninety six hours a fortnight In addition each nurse is to be given a separate bedroom and senior members of the trained staff are to be allowed to live out if they wish

The Marylebone Borough Council Crematorium which has been built at a cost of £30 000 in the Council's cemetery at East Finchley to the design of Sir Edwin Cooper R A, was formally opened on December 15 It will not be restricted to residents of Marylebone Councillor G B Ramsay chairman of the Cemetery Committee said that unless cremation was more generally adopted ratepayers would have to find large sums to acquire for burial grounds land which could be used to greater advantage for recreational and other purposes

Speaking from the chair at the annual dinner of the Old Mancunians Association on December 17 Professor W Fletcher Shaw paid tribute to the lead which Manchester Grammar School had given to the public schools of this country in the way of medical supervision of its pupils through the pioneer work of Dr A A Mumford many years ago The first need of a great English school was to show that physical and mental development were complementary He was surprised that Manchester's example had impressed itself so little on other schools Schoolmasters seemed to think that medical men had nothing to do with adolescence at few public schools was the medical supervision anything like so good as it was at Manchester

On December 14 the Duke of Gloucester attended a general court of governors of St Bartholomew's Hospital and received the charges of president and of a governor of the hospital His Royal Highness said that in becoming a governor and president of St Bartholomew's he was maintaining a family tradition because he succeeded his eldest brother the Duke of Windsor his father King George V and his grandfather King Edward VII Before leaving the Duke was enrolled as a Perpetual Student of the Medical College

The Council of the Royal Society has appointed Dr. M C G Israels assistant director of the department of clinical investigation in the Manchester Royal Infirmary to a Loulerton Research Fellowship The appointment will date from January 1 1938 Dr Israels proposes to carry out research on the nature and causes of blood disorders and allied conditions

The Home Secretary has appointed Dr P J Lythgoe to be a member of the committee to inquire into the standards of lighting in factories in place of Dr C S Myers F.R.S. who has resigned

Dr C E Newman has been appointed Subdean of the British Postgraduate Medical School

HILL END HOSPITAL AND CLINIC

QUERIES AND ANSWERS

Painful Tongue

Dr A F G SPINKS (Newcastle upon Tyne) in reply to Worried (*Journal* December 18 p 1259) writes I suggest that the above-mentioned condition may be due to dentures which are being kept clean by the use of one or other of the various substances now advertised for the purpose Such substances when in contact with the vulcanite of the denture form I think a chemical compound—as yet unknown—which is very irritating to the tongue The remedy in such a case is obvious

Generalized Psoriasis

Dr F SPENCER DAVIES (Essex) in reply to M B B Ch (*Journal December 11, p 1206*), writes *I suggest his* patient is suffering from chronic intestinal intoxication the relief of which will relieve her psoriasis and improve the chronic infective arthritis The most successful way to treat this intoxication is by fasting The patient should only be allowed six oranges a day with a hot drink of tomato juice in the evening Enemas and colonic irrigation are useful adjuncts, and M B B Ch should find that the desquamation from the psoriasis begins rapidly to lessen after fourteen days A few days earlier a cereal vegetarian and fruit diet may be taken No external treatment beyond warm soda baths and a mild soothing ointment is necessary

Income Tax

Partnership Assessment

£ s d is a member of a firm The firm s accountant calculates each partner s share of the firm s assessable profits and individual statements of total income are made including such amounts Each partner pays the tax on his share to the accountant, who pays the total amount to the collector Is this correct?

*** Under the Income Tax Acts a partnership is assessable in one sum and the senior acting partner is primarily responsible for payment of the tax on the whole of the profits, and is of course entitled to reimbursement as appropriate from the other partners £ s d cannot demand to be separately assessed in respect of his particular share and a request for that to be done can be, and will be refused by the authorities

LETTERS, NOTES, ETC

An Exchange Scheme for Medical Students

Mr A D LEIGH B.Sc whose first letter appeared in the *Journal* of August 7 (p 306) writes again from Budapest The exchange students have now left In August there was first a visit to Chinoin the chemical factory here then the Kozponti Tej invited the students to inspect one of their central dairies The different processes of pasteurization ultra violet irradiation and bottling to which the milk was subjected were demonstrated to them The whole milk supply of Budapest is pasteurized In their Kavehaz in the Varosliget the company entertained the students to a feast of their many milk products The very new radium hospital, endowed by the Rockefeller Institute, was proudly shown to the group, and after the holiday of Szent Istvan a number of the students travelled to Debrecen in Western Hungary The university clinics there are very modern and well planned, serving a wide agricultural area The scheme for the exchange of students has been in effect here for about five years This is the first year, however that an exchange has been made with England and two Hungarian students travelled to the Manchester Royal Infirmary The president of the Hungarian Medical Students Association tells me that next year it is hoped that at least *five exchanges will be made with England, probably through* the National Union of Students

Subcutaneous Emphysema during Labour

Dr B SAMUEL (Glamorganshire) writes Reading Dr F H Nussbaum s interesting report of the above condition (*Journal* December 11 p 1169) I recalled seeing a similar case in August, 1935 while acting as a locumtenent in Llanrhaidr, North Wales The patient a primipara had a greatly swollen face and neck and both eyes were closed It had been a very strenuous labour the child was still born and on my arrival the midwife a hardy veteran remarked that it was a wonder that she hadn t burst herself straining so much" My first impression was that the case was one of an acute post natal eclampsia or possibly an atypical erysipelas but guided by the lady s instinctive remark further examination revealed the signs of an undoubted emphysematous condition The condition cleared up in a few days

Colour Films

Dr HORATIO MATTHEWS (London W 1) writes In the *Journal* of October 3, 1925 (p 632) I drew attention to a process for the making of colour films which I had invented and appealed for collaboration on account of expense The method was referred to in the following words A dye bath stains the exposed part of the film along the fine cuts made by the knives but leaves the greased part protected and ready for further operation by the knives and different colouring' In June, 1933, somebody unknown to me patented the Dufay process in the following words 'A small fine irregular pattern of greasy ink (intended to act subsequently as fatty resists) is placed on the film In a specification of mine for colouring articles, taken out in May, 1923 referring to film making the words used were 'A method of colouring bodies' by a process of coating part or all of the body with a medium repellent' to the colouring medium The repellent medium is a substance immiscible with the colouring medium and over which the colouring medium has little tendency to flow, and is preferably a fatty substance'

Carr Manor, Leeds

With reference to the announcement in the *Journal* of December 11 that the Leeds Corporation had bought the late Lord Moynihan s house Carr Manor Meanwood Leeds a correspondent reminds us that Sir Clifford Allbutt lived there during the last eight years of his time of practice in Leeds Sir Humphry Rolleston s *Memoir* states that *In 1881 the Allbutts moved from Lyddon House to Carr* Manor, Meanwood about five miles from Leeds station, Allbutt of course retaining his consulting rooms in Park Square as before Carr Manor which they had been building *for some two years, was a fine house with remarkably* handsome iron gates hand wrought and of Italian workmanship It was afterwards occupied again by an outstanding medical man in Yorkshire Lord Moynihan, elected President of the Royal College of Surgeons of England in 1926

Corrigendum

In an abstract of an article by H Teitge in the *Medizinische Klinik* of August 27 (Epitome paragraph 431 in the *Journal of November 27 p 82) the impression* was conveyed that improvement had been observed in decubitus and gangrene of the limbs in diabetes and in Raynaud s disease following the administration of folliculin progynon or any other similar preparation What the author actually said in his article was that *no* improvement followed such therapy

NEW LODGE CLINIC, WINDSOR FOREST

This Clinic was founded in 1921 in order to provide for the scientific investigation and treatment of disease by a team of physicians and specialists

All forms of non-infectious medical cases are admitted special attention being paid to disorders of digestion and metabolism arthritis anaemias asthma heart and kidney disease and functional and organic nervous disorders

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

513 Staphylococcus Aureus and Listerella Meningitis

R L JACKSON (*J Pediat* October, 1937 p 518) adopts the following classification of staphylococcal meningitis which is based on that of Schless (1) Localized abscess of the meninges caused by extension of suppuration from contiguous structures (numerous recoveries have been recorded from this type after operation) (2) Meningitis accompanied by characteristic evidence of cerebrospinal inflammation (*a*) without septicaemia (*b*) with septicaemia Jackson's case, which occurred in a girl aged 24 years was an example of 2(*b*) Treatment consisted in frequent cisternal drainage to reduce intracranial pressure and general supporting measures such as the parenteral administration of glucose and Ringer's solutions, and blood transfusion

514 M A POSTON S E UPCHURCH and M BOOTH (*J Pediat* October 1937, p 515) record a case of purulent leptomeningitis due to a new pathogen of the genus Listerella in the form of a haemolytic Gram-positive bacillus first described by C G Burn in 1933 The case which is the seventh on record in which this organism was isolated, occurred in a boy aged 3 years No definite organism was found in direct smears nor was any growth obtained from cultures of the spinal fluid during life Death took place after five weeks illness At necropsy a subdural abscess was found cultures of which showed a Gram positive bacillus that produced beta haemolysis in blood sugar

515 Suprarenal Insufficiency in Malaria

PEREGRINO jun., and P P BRANDAO (*Brasil Med* October 16 1937, p 1047) record seventeen illustrative cases of malaria complicated by suprarenal insufficiency in patients whose ages range from 17 to 54, of which three are described in detail The acute form which is much the commonest may be divided into the following five groups (1) a cardiac form, with tachycardia, hypotension and dyspnoea, (2) a gastro intestinal form with continual vomiting choleriform diarrhoea, and abdominal pain (3) a peritoneal form simulating peritonitis (4) a nervous form characterized by coma, apoplectiform symptoms or Ménière's syndrome (5) psychical disturbances Incomplete forms may also occur with dyspepsia asthenia, or neurasthenia Chronic suprarenal insufficiency or Addison's disease is rare in malaria

516 Jugular Phlebitis

According to O MEYER (*Zbl inn Med* September 11 1937 p 753), the commonest cause of phlebitis in the jugular vein is acute tonsillitis such phlebitis untreated becomes latent or chronic and is demonstrable by persisting tenderness Jugular phlebitis if sought, is found with surprising frequency It is often a cause of cephalic symptoms such as trigeminal or occipital neuralgia or migraine of sinus diseases chronic eye infections or arthritis of the head or neck and more remotely (from its function as a focal zone of sepsis) of general articular inflammation Jugular phlebitis is found on one or both sides and in the former case the cephalic symptoms are on the same side hot applications provoke further extrusion of toxins into the blood stream and Meyer has frequently seen for example a brachial neuritis aggravated by poultices to the neck In over a hundred cases he observed that cure of chronic jugular phlebitis was followed by cure of sinus disease, neuralgia migraine arthritis of mandibular joints or deafness The only effective treatment is stated to be application of three or four leeches subsequent oozing being allowed to continue for eight to ten hours The majority of cases have shown pathogenic cocci in the oozing blood Meyer states that latent jugular phlebitis, when causing acute articular rheumatism, usually coexists with latent crural phlebitis, this acts as a focus of infection, and should be treated

Surgery

517 Resection of the Clavicle in Pulmonary Tuberculosis

G PIERI (*Policlinico* Sez Prat, September 13 1937 p 1725) records two cases—in males aged 18 and 45 suffering from tuberculosis of the upper lobe of the lung and unsuitable for treatment by artificial pneumothorax—in which upper thoracoplasty was followed at the same operation by resection of the middle third of the clavicle Pieri claims that the operation presents the following advantages (1) it facilitates the removal of tension in the muscles with costal insertion which causes expansion of the thorax (2) it modifies the respiratory mechanism by reducing the expansion of the lung (3) it causes a drop in the scapulo humeral girdle by increasing the downward pressure produced by thoracoplasty

518 End results of Nephrotomy

H KOPP (*Z Urol* 1937, **31** 11 749) believes that improvement in the technique of nephrotomy has made this operation one of the most important in conservative urinary surgery In his clinic Rehn's method is used, which demands a careful incision and precise adaptation of the wound edges while stitching and the avoidance of damming up of urine and of fixation of the kidney Fourteen cases were operated on in the last three years In twelve there was no post operative haemorrhage in two the haemorrhage stopped two to three days after operation and gave rise to no concern The author believes that if post-operative haemorrhage occurs following the use of Rehn's method the kidney and not the operative technique is at fault Kopp has never seen a urinary fistula develop after this operation, which is only employed to remove calculi Modern methods of diagnosis have so improved that nephrotomy is no longer performed as a diagnostic measure Kopp examined the grave criticism of the operation that nephrotomy invariably does irreparable damage to renal tissue He points out that nephrectomy may be unhesitatingly carried out provided that the other kidney is healthy with the knowledge that it will be sufficient to perform its duties There seems to be no valid reason therefore why in nephrotomy a part of the parenchyma should not be sacrificed in order to maintain the whole organ In four cases carefully examined before operation and six to twelve months after it Kopp was able to demonstrate that the function of the nephrotomized kidney had improved considerably in spite of some loss of parenchyma and that its function was as good as that of the healthy kidney

519 Sympathectomy for Essential Hypertension

E V ALLEN and A W ADSON (*Amer Heart J* October 1937 p 415) studied the physiological changes in forty-five patients operated on for essential hypertension Resection of the splanchnic nerves and the coeliac and upper two lumbar ganglia was performed on one side and then the other ten days later By this means the arterioles were disconnected from the vasomotor centre and a state of decreased vasoconstriction induced The authors found that the results of operation can be predicted with reasonable certainty by observing the response of the blood pressure to rest and sleep, to ingestion of sodium

amytal, and to injection of pentothal sodium A pessimistic prognosis is usually right, an optimistic one often wrong In their series 45 per cent of patients received no benefit from the operation, in 30 per cent the blood pressure was slightly lowered, and in 25 per cent it was greatly lowered In eighty-five successive cases there were no deaths due to operation Amelioration of symptoms was found in 70 per cent of cases even when there was no great reduction of the blood pressure No disablement follows operation, although anhidrosis of the lower extremities and probably sterility in the male result Orthostatic hypotension and tachycardia occur, but these disappear some time after operation The heart usually decreases in size, retinitis diminishes or disappears, renal function is improved, and the basal metabolism is lowered The authors do not believe that sympathectomy is the ultimate contribution to the treatment of hypertension, but the results are encouraging enough to induce them to continue with it until a better method has been devised

Therapeutics

520 Staphylococcal Septicaemia

A GROSS (*Thèse Paris* 1937, No 672) states that, with the exception of that accompanying osteomyelitis, staphylococcal septicaemia has a very grave prognosis Only three forms of specific treatment are possible—namely, (1) injection of immune serum, (2) formol toxoid (and its derivative Ramon's anti-staphylococcal preparation), and (3) intravenous injection of bacteriophage Apart from cases reported by Tzank, injections of immune serum have not yielded the brilliant results expected, while formol toxoid is apt to give rise to severe and even fatal reactions, and does not appear to be polyvalent On the other hand, intravenous injection of bacteriophage has yielded excellent results A certain degree of shock may occur, but no fatal cases have been recorded

521 Intravenous Scilla Treatment

L ZWILLINGER (*Wien Arch inn Med*, October 31, 1937, p 201) records satisfactory results from intravenous treatment by scillaren (a combination of the pure glucosides of squill, scillaren A and B) in 104 cases of cardiac decompensation, including seventeen of valvular disease, eighteen after coronary thrombosis, and forty-three in patients with vascular hypertonia The following classes were excluded as unlikely to respond well to any cardiac glucoside patients with Graves's disease, rheumatic pancarditis, mitral disease with symptomless lung emboli mitral stenosis with lung oedema (here the right heart is good and circulation time only slightly slowed), or emphysema—as well as the class, first distinguished since the introduction of the mercurial diuretics, which responds to these but shows little or no improvement from rest and fluid restriction The results were assessed by measurement of the venous pressure circulation time, and vital capacity, as well as by clinical, radiological, and electrocardiographic signs the action was found to be predominantly systolic (circulation time being diminished in certain cases without alteration of pulse frequency) and extremely rapid The dosage was moderate, no single amount exceeding 0.5 mg the average doses being 0 35 mg twice or thrice daily, diminished as soon as the desired effect had been obtained Extrasystoles after intravenous medication call for much care, especially if taking a continuously bigeminal form Scilla glucosides are probably broken down quicker than all others and are thus specially applicable when there is danger of intoxication (as after myocardial infarction) In several cases scillaren medication was continued, with in the end satisfactory slowing of the heart, in spite of temporary induction of auricular fibrillation.

Dermatology

522 Electrocoagulation for Lupus Vulgaris

V GENNER (*Ugeskr Laeg* October 21, 1937, p 1109) reports from the Finsen Institute in Copenhagen his experiences of forty-two cases of lupus treated by electro coagulation For many years the treatment of lupus at the institute was with Finsen light supplemented by surgical excisions (as distinct from electrical excisions) when these seemed indicated Cures were thus effected in about 70 per cent the remaining 30 per cent becoming cases of chronic relapsing disease, the blame for which in many instances depended on the disinclination or inability of the patients to attend regularly During the past four years the author has sought to improve these results by supplementing Finsen treatment in some cases by electrocoagulation He notes in passing that there is a general tendency abroad, particularly in Germany, to dispense with Finsen treatment as being too lengthy and costly, and to employ the short cut which electro excision offers The author is, however, of the opinion that Finsen treatment still gives the best results, from both the recovery and the cosmetic aspect, provided it is administered by persons competent to deal with such a capricious disease as lupus from the clinical biological, and technical points of view Electrocoagulation cannot be advocated as an alternative to Finsen treatment, but only as a supplement to it, early or late in the disease, in a limited number of cases Electrocoagulation may be employed in the destruction of isolated and well defined foci or in the superficial destruction of more extensive infiltrations as a preliminary to Finsen treatment The cosmetic results of electrocoagulation are inferior to those of Finsen treatment, the former giving rise to more fibrosis of the skin

523 Vitamin C in Psoriasis

Clinical improvement after administration of vitamin C in psoriasis has been noted by F REISS (*Derm Wschr* October 30 1937, p 1418) and by Lutz in a few cases Reiss now finds from investigation of twelve out-patient cases of psoriasis, that the vitamin C excretion in the urine is very low (10 5 mg daily as an average) and that the great bulk of vitamin C administered therapeutically is retained Excretion of sulphur is considerably diminished, but it rises to a slight extent if ascorbic acid is given The C-hypovitaminosis in psoriasis is probably due to inflammatory processes and the increase in oxidation accompanying increased keratinization No clinical improvement occurred in the cases here described—possibly because the dosage employed did not approximate to saturation

524 Cutaneous Eruptions in Gonorrhoea

O L LEVIN and S H SILVERS (*N Y St J Med* October, 1937, p 1712) present a review of the literature on the skin complications of gonorrhoea Eruptions may be localized near the genitals—due to infection from the discharge—or they may be generalized In the latter case the gonococci are carried by the blood stream to the skin, where eruptions result from the action of the micro-organisms and their toxins The generalized eruptions are a portent of serious systemic disease The eruption may be of four kinds (1) erythematous, with or without vesicles, (2) urticarial erythema and lesions resembling erythema nodosum, (3) haemorrhagic, (4) hyperkeratotic Four cases are described three of which were haemorrhagic and one hyperkeratotic One of the haemorrhagic cases was fatal Particular emphasis is laid on this haemorrhagic type which is considered to be due to the invasion of the skin by gonococci, with the development of embolic phenomena (A similar condition has been observed in meningococcic septicaemia) The petechial lesions usually do not occur profusely a dozen, or fewer,

F.R.C S

A COURSE in OPERATIVE SURGERY for the Final Fellowship Examination in February next will begin on Monday January 17th 1938 The fee for the course will be Ten Guineas

Further particulars may be obtained from Dr A. E. CLARK KENNEDY M D F R C P Dean London Hospital Medical College, Turner Street, E 1

new lesions may appear with each crop and they are accompanied by a sudden rise of temperature The areas usually involved are the extremities, especially in the region of the joints The spots appear as red-blue macules, changing to elevated purplish slightly umbilicated haemorrhagic vesiculo pustules of a greyish brown colour These eruptions should be differentiated from similar lesions due to the concomitant use of drugs The keratotic lesions may be differentiated from psoriasis by the history, symptoms, cutaneous manifestations blood picture and blood culture histopathology, and clinical course

525 Chronic Pyodermia

J A FOLPMERS (*Nederl Tijdschr Geneesk* November 6, 1937, p 5408), who records seven cases of chronic pyo dermia in patients aged from 27 to 51, of whom five were men and two women, states that clinical and histological appearances in such cases can be best described by the term ' pyodermia chronica papillaris et exulcerans He emphasizes the difficulties of differential diagnosis, espe cially from cutaneous tuberculosis

526 Cutaneous Papillomatosis

F WISE and W SACHS (*Arch Derm Syph* Chicago September 1937 p 475) describe a case of cutaneous papillomatosis which they believe to be one of the group of rare dermatoses described by Gougerot and Carteaud in 1932 (*Arch Derm Syph* Wien 1932, **165** 232) This case resembles those of the second group of Gougerot and Carteaud which they call confluent and reticulated papillomatosis The patient was a woman aged 23 who had had a cutaneous eruption for seven years The eruption affected most of the body surface only the scalp palms and soles being free from it It was most marked on the chest neck and shoulders axillae intermammary and epigastric regions antecubital and inguinal areas and on the middle portion of the lumbar region The form it took varied somewhat from place to place, but typically was papular or papulo squamous and confluent or isolated The larger lesions were from 3 to 4 mm in diameter and were dark red or brown, moderately elevated and of a warty appearance On the intermammary and epigastric regions the eruption resembled pityriasis versicolor Histological examination revealed a pro nounced hyperkeratosis the prickle-cell layer was reduced in width the surface configuration was wavy some of the papillary bodies extending upwards beyond the mean level of the epidermal outline The prickle cells were small and rounded the prickles were not visible The treatment used was an ointment containing 6 per cent salicylic acid and 4 per cent ammoniated mercury which cleared up the eruption though papules appeared again a few days after cessation of the treatment The patient exhibited hypertrichosis advancing obesity irregular menstruation and possibly slight hyperthyroid-ism so that endocrine imbalance was suspected No similar case report could be found in the American literature

527 Eczema in a Saltpetre Factory

O J BROCH (*Tidsskr norske Laegeforen* November 1 1937 p 1122) has studied thirteen cases of eczema at a saltpetre factory in Norway and has applied Bloch s skin test (apposition for twenty four hours to the skin of a pad of linen soaked in a solution or extract of the suspect chemical and covered by waterproof sheeting) to all of them In seven cases he has obtained a definitely positive reaction to one or other of the chemicals with which the patients had been in contact for years It was significant that the average age of the patients was as high as 45 The author connects this observation with Burckhardt s finding that the capacity of the skin to neutralize alkalis diminishes with age Although these thirteen patients had been exposed to the various chemicals ever since beginning work in the factory, there was an average interval of ten years between the first exposure and the first appearance of eczema This suggests that the allergic condition of the skin had taken a long time to develop In some cases the use of rubber gloves was soon followed by a considerable improvement in the eczema, which was worst on the hands and fore-arms In the most obstinate cases the author found it necessary to recommend a change of employment, and he suggests that persons whose skins are liable to develop eczematous conditions should not seek employment in any eczema promoting vocation This advice is the more to the point because industrial legislation in Norway and most other countries has not hitherto recognized eczematous conditions as occupational diseases qualifying for compensation by law This anomalous state of affairs, rectified in Germany in 1937 is the more deplorable as the most common form of occupational disease is precisely disease of the skin

528 Ovarian Extract in Pruritus

L N ELSON (*Urol cutan Rev* October, 1937, p 713) considers that pruritus vulvae and pruritus senilis are degenerative neuritides, and, on the theory that the ovaries form specific nerve regenerating hormones has for sixteen years been treating cases of these diseases with an extract of whole ovary He gives 5 grains three times daily one hour before meals on the first day, two doses the second day and one dose the third day, continuing the same sequence for many weeks He finds the results excellent in both sexes He uses the same treatment for brachial neuritis and for the atrophic arthritides of the female and male climacteric and in the aged with good results For local application he recommends saturated solutions of sodium bicarbonate or magnesium sulphate as com presses or camphor and menthol 2 per cent each, in liquid paraffin

Obstetrics and Gynaecology

529 The Menstrual Cycle

J BJÓRNSSON (*Nord med Tidskr* October 2, 1937 p 1613) reports from the University Hygiene Institute in Oslo observations conducted between September, 1932, and June 1933 on 321 probationer nurses 180 of whom, with an average age of 23 6 years, had conscientiously filled in certain forms giving information about their illnesses their weights and their menstrual cycles The average age at which menstruation began was between 14 and 15 the extremes being 11 and 18 The average dura-tion of menstruation was 4 5 days By the menstrual interval the author means the time between the first day of menstruation and the first day of the next menstruation The length of this interval varied greatly not only in different nurses but also in one and the same nurse Indeed there were only eleven nurses each with a differ-ence of five days or less between the longest and the shortest interval There were seventy-one nurses each with a difference of ten days or less between the longest and the shortest interval and there were as many as 104 nurses each with a difference of over ten days In other words the menstrual cycle of nearly 60 per cent of all the nurses was quite irregular The author finds that the new and strenuous conditions under which these nurses lived and their comparatively high sickness rate account only in part for this irregularity which he regards as an expression of a normal variation in the length of the menstrual interval The disagreement on this score between his own observations and textbook dicta reflects, he maintains, on the inaccuracy of the hearsay information on which textbook writers have based their conclusions

CITY AND COUNTY OF THE CITY OF CHESTER

DEPUTY MEDICAL OFFICER OF HEALTH AND DEPUTY SCHOOL MEDICAL OFFICER

Applications are invited for the above-mentioned appointment from duly registered medical practitioners of not more than 35 years of age.

The salary offered will commence at £600 per annum rising by annual increments of £75 to a maximum of £700 per annum.

Further particulars of the duties, terms and conditions of the appointment and application form can be obtained from the Medical Officer of Health, Town Hall, Chester, to whom applications (to be made on the form provided) accompanied by copies of three recent testimonials are to be delivered not later than Wednesday, January 12th, 1938.

The successful applicant will be required to pass a medical examination and to contribute 5 per cent. of his salary to the Council's superannuation fund.

Canvassing directly or indirectly will be a disqualification.

J. H. DICKSON
Town Clerk.

CORPORATION OF KIRKCALDY

FEVER HOSPITAL AND SANATORIUM

Applications are invited from registered medical practitioners for the post of RESIDENT MEDICAL OFFICER at the above hospital. The salary is £250 per annum with board, residence and laundry. The successful candidate will be required to undergo a medical examination and to contribute to the Corporation's Superannuation Scheme. Forms of application may be obtained from the Medical Officer of Health, Public Health Department, Kirkcaldy, to whom they should be returned together with copies of three recent testimonials not later than December 31st 1937.

WILLIAM HUTTON
Town Clerk, Kirkcaldy.

BRITISH POSTGRADUATE MEDICAL SCHOOL

Applications are invited from fully qualified medical practitioners for the post of CASUALTY OFFICER to commence duty on March 1st, 1938.

The appointment is for six months and non-resident. Salary is at the rate of £150 per annum and the post is specially suited to candidates studying for higher qualifications.

Applications accompanied by two testimonials should be addressed to the Dean, British Postgraduate Medical School, Ducane Road, W.12, to arrive not later than the first post on Monday, January 10th.

He also points out that his findings upset the myth of a regular twenty-eight-day interval, on the existence of which Knaus has built up his birth control system, for, considering that the length of the menstrual interval in one and the same woman may range from twenty to forty days, it cannot be easy to identify the 'dangerous" ovulation period, which occurs, according to Knaus, fifteen days before the next menstruation

530 Menstrual Allergy

G SINGER (*Med Welt* September 11, 1937, p 1273) points out that it has long been known that certain conditions occur only during menstruation, while other more chronic ones relapse at this time Recent research groups these disorders into a mild form due to vasomotor disturbances and a severe form due to vascular changes Two lipoids, carotin and cholesterin, are found in the blood in larger quantities during menstruation Proteolytic ferments and histamine are present in menstrual blood, and the latter also in the circulating blood of menstruating women Increase of blood cholesterin and histamine predisposes to allergic states, and the part played by the liver in dealing with these substances is important Singer states that in his cases of menstrual allergy some damage to the liver could be demonstrated or confidently assumed The intake of substances likely to damage the liver must be forbidden Proteins and fats should be taken in moderation, carbohydrates in plenty Mineral waters containing magnesium sulphate are of value The author advocates also the administration of peptone, 1/2 to 1 gramme, before meals The effects of histamine can be counteracted by treatment of the gastro intestinal tract The oral administration of concentrated glucose solution may be of value in the prevention of attacks

531 Intra-uterine Asphyxia

E VOGT (*Munch med Wschr* October 22, 1937, p 1690) discusses the prevention and treatment of intra-uterine asphyxia In cases where the asphyxia is caused by a spasm of the lower uterine segment—as, for example, after too large doses of pituitary preparations or after an artificial rupture of the membranes and manual dilatation of the os—spasmolytic remedies, such as belladonna with or without the addition of narcotics, are indicated They are best given in the form of rectal suppositories Where the cause of the asphyxia is obscure and compression of the umbilical cord can be excluded, the author advises cardiazol, given through an intramuscular injection to the mother, or directly to the child in cases where the child's breech is accessible In cases of uterine fatigue with spasm of the lower uterine segment the intramuscular injection of 1 c cm of dilaudid is indicated The number of operative deliveries for the sake of the child has been greatly reduced since the introduction of cardiazol as a preventive and curative remedy for intra-uterine asphyxia Where the intra-uterine asphyxia is caused by an increased resistance of the soft parts the author advises episiotomy under ethyl chloride or ether anaesthesia

532 Relaxin in Human Serum

D ABRAMSON E HURWITT and G LESNICK (*Surg Gynec Obstet* September 1937, p 335) review the work of Hisaw and others on the hormone known as relaxin, which is supposed to be elaborated by the corpus luteum and to cause relaxation of the pelvic ligaments during pregnancy It has been found that slight to moderate degrees of relaxation can be produced in guinea-pigs by the injection of large doses of theelin, but that the separation is greatly increased by a small additional dose of relaxin Pelvic relaxation in pregnant animals is therefore not solely a theelin effect There is a synergistic relation between theelin and relaxin The authors have now developed a method of concentrating human serum taken from women in the first half of pregnancy which has acted on guinea-pigs in a manner similar to that of relaxin The animals are ovariectomized in order to eliminate their own supply of ovarian hormones Artificial oestrus is then produced with theelin and specially prepared serum from the pregnant woman is injected The sera of fifteen consecutive women in the first half of pregnancy produced relaxation of the symphysis in the guinea-pig The serum of one woman in the eighth month and that of two non-pregnant women and one man were non-effective It is believed that pelvic relaxation during pregnancy is facilitated by or is due to the hormone relaxin in the human species as well as in many other mammalia, and that the hormone is produced only or mainly during the first half of pregnancy As a routine test of pregnancy the procedure is considered impracticable

Pathology

533 Vitamin C and Thermo-regulation

F HASSELBACH (*Schweiz med Wschr* September 11, 1937, p 877) found an intimate connexion between fever and the consumption of vitamin C The body consumes more vitamin C whenever the temperature rises above normal There is an instability of the thermo regulating mechanism in scurvy and in cases of insufficiency of vitamin C This instability can be remedied by the administration of the vitamin In such cases large doses of ascorbic acid cause a critical drop in the temperature In pulmonary tuberculosis the administration of vitamin C may improve the toxic condition, and in this way lead to a decrease of the fever Vitamin C also improves the vasomotor excitability and the capillary circulation, two important factors in thermo regulation

534 Histogenesis of Leukaemia

E STORTI and P DE FILIPPI (*Folia haemat* Lpz., 1937, 58, 1, 20) attempt to disprove the theory that the reticulo histocytic system is responsible for the histogenesis of extramedullary leukaemic tissue They used hens infected with 1 c cm of blood injected from a leukaemic fowl, for material from human necropsies is worthless, and in humans it is practically impossible to make the reticulo histocytic system visible Vital staining was obtained by repeated injections of 10 c cm of stain in 10 per cent normal saline Examination of the material proved conclusively that the reticulo histocytic system showed no morphological characteristics indicating its active participation in the histogenesis of extramedullary foci They believe that the latter are due to abnormal proliferation of leukaemic elements prematurely released from the bone marrow

535 Inclusion Bodies in Measles

JEAN BROADHURST MARGARET E MACLEAN and V SAURINO (*J infect Dis* September–October, 1937, p 201) describe the occurrence of characteristic inclusion bodies in measles They are usually globular, less often irregular or elongated, and may be intranuclear or in close opposition to the nucleus They are found in the ciliated and columnar epithelial cells of the nose and in the globoid basal cells of the Koplik spots The inclusion bodies are best demonstrated by staining with nigrosin, which leaves the surface bacteria uncoloured They may be seen on the first day of the disease, and, judging from an examination of 110 patients, they are consistently found from the second to at least the twelfth day Similar bodies were present in only two out of forty control patients, one patient was diagnosed as suffering from a streptococcal infection of the nasopharynx, the other from a nasal abscess

COUNTY BOROUGH OF BIRKENHEAD

DEPARTMENT OF THE MEDICAL OFFICER OF HEALTH.

BIRKENHEAD MUNICIPAL HOSPITAL

DEPUTY MEDICAL SUPERINTENDENT

Applications are invited for the appointment of Deputy Medical Superintendent (Resident) at the Birkenhead Municipal Hospital (547 Beds)

BRISTOL —PARTNERSHIP WITH GOOD *scope Total panel 2 200* £2 125 last year Half share at £2 000 House in very good condition £60 p a —THE WESTERN MEDICAL AGENCY, 22 Clare Street Bristol 1 (Bristol 22689) and 15 Bedford Street Strand W C.2 (Temple Bar 2532)

EAST ANGLIA PARTNERSHIP THIRD OR HALF SHARE in good middle-class practice in country town averaging £4 000 panel 3 000 Hospital 60 Beds surgery essential Premium 2½ years purchase, house available to rent.—Address, No 1605 B M.A House Tavistock Square, W C 1

PARTNER REQUIRED COUNTRY TOWN Practice in East Anglia averaging £6 700 p.a One-seventh share for sale to well-qualified man ½ later House available —Address No 2602 B M A House Tavistock Square W C 1

the excretion of vitamin C may be normal or subnormal according to our present standards but in either event vitamin C has no effect on the symptoms or the signs of the disease

Wilbur (1937) comes to the same conclusion in a review of papers published on vitamin C and it would appear as if those who have reported improvement have paid too little attention to the facts that many haemorrhagic states recover spontaneously and that diseases as serious as acute leukaemia may show temporary remissions Vitamin C now takes its place with liver extract iron, thyroid, and pentnucleotide as a remedy which has a well-defined and restricted sphere of action on the blood and its containing vessels It is not my intention to minimize that sphere of action, as I believe that subclinical and atypical scurvy is a good deal commoner than most of us used to believe Archer and Graham (1936) and others have shown that many patients with peptic ulcer suffer from subclinical scurvy, and that it is specially important to secure saturation with vitamin C in the face of haemorrhage or operation Ingalls (1936) regards subclinical scurvy as an important factor in chronic subdural haematoma Latent scurvy should be suspected whenever unexplained bleeding occurs in patients with alcoholism or with dietetic or digestive abnormalities, and the diagnosis should be clinched by chemical estimation of the vitamin in the body fluids, if possible and by observation of the effect of treatment on the symptoms and the capillary fragility In neither of the following two cases was the vitamin C content of the blood or urine estimated but they nevertheless suggest that avitaminosis C due to defective diet may favour the occurrence of subcutaneous bleeding in hyperpiesia and nephritis It will save time to state that in both men the blood count, platelets, bleeding time, and coagulation time were normal

Peter F aged 55 had been working with a metal drill pressed against his lower abdomen as he had done many times without incident before A day or so later his temperature rose and it was discovered that he had a wide extravasation of blood over the pubes and perineum passing on to the penis and scrotum There was also a bruise on the right forearm He had had dysentery twenty years before and since that time had avoided fruit and green vegetables He had had a cloud of albumin in the urine for many years and the blood pressure was 210/120 though the blood urea was only 23 mg per 100 c cm. There were no other abnormal signs and the temperature returned to normal in ten days He was treated with a high vitamin C diet including orange and tomato juice Two months later there had been no recurrence of the bleeding and the tourniquet test was negative

Albert C aged 49 presented himself with a spontaneous large bruise on the right shoulder He had had gout for eight years and a year before had had an attack of unconsciousness suggestive of hypertensive encephalopathy He drank six pints of ale a day and his meals were hurried and irregular The urine contained a trace of albumin the blood urea was 76 mg per 100 c cm and the urea clearance in the urine was only 26 per cent of the normal The blood pressure was 185/120 and the tourniquet test was positive He was treated by restriction of alcohol a high vitamin diet, atophan three days a week and ascorbic acid 100 mg a day by mouth on the other four days Two months later he had had no more bleeding and the tourniquet test was negative although the blood pressure had risen to 240/150

Nutrition and Haemorrhage

Even more important than the isolation of ascorbic acid is the impact of biochemistry on the haemorrhagic states the ability to reproduce them in animals and the exchange of fertilizing ideas between ward and laboratory The bearing of nutrition on the haemorrhagic states is not limited to scurvy and vitamin C Szent Györgyi (1936) and his colleagues were at first disappointed to find the action of pure ascorbic acid limited to scurvy as they had successfully treated cases of non thrombocytopenic purpura with impure preparations of vitamin C They have now isolated from these sources a substance flavon which they have called vitamin P as they believe it influences the permeability of the vessels Nothing is more difficult than to establish criteria for capillary permeability and its variation in haemorrhagic states nor is it easy to prepare large quantities of flavon For these reasons little further progress has been made on these lines

Fanconi (1928) in his work on intestinal infantilism noted not only scurvy but also a condition resembling haemophilia due to a defect in the coagulating power of the plasma Other paediatricians have observed the same phenomenon in undernourished children and have been able to relieve it by a diet rich in protein (Kugelmass 1932) Prothrombin is present in abnormally small amounts in the blood of the newborn infant, and it is probable that the haemorrhagic disease of the newly born melaena neonatorum, is due to depression of prothrombin below a certain critical level (Brinkhous *et al* 1937) A disorder characterized by a lack of prothrombin in the plasma has been produced in birds by a defective diet (Dam *et al* 1937) Haemorrhagic chick disease is due to deprivation of a fat soluble vitamin the Koagulations Vitamin or vitamin K which is present in mammalian liver egg yolk, and certain vegetable substances such as alfalfa It is doubtful whether haemorrhagic chick disease can be exactly duplicated in mammals A very similar disorder the sweet clover disease of the rabbit is likewise due to lowering of the prothrombin in the plasma, but though it is a dietetic disease it does not appear to be identical with haemorrhagic chick disease and while it can be cured by extracts of alfalfa the curative fraction is said to have properties different from those of vitamin K (Quick 1937) At present it is not clear what bearing these discoveries will have on human therapeutics Liver and vitamin K have no action on hereditary haemophilia but there remains a wide field for study in the treatment of melaena neonatorum and the haemorrhagic manifestations of malnutrition and disease of the liver

In the paper from which I have previously quoted Kugelmass (1932) advised a diet rich in fat and vitamin D to increase the platelets in purpura haemorrhagica The literature of the use of vitamins A and D in the haemorrhagic states is confusing and contradictory Vitamin A almost certainly has no haemostatic properties Vitamin D calcium and parathormone form a mysterious trinity whose aid has been invoked in especial against the haemorrhagic symptoms of diseases of the liver though they have been recommended in all forms of morbid haemorrhage (McNealy *et al* 1935 Lowenburg and Ginsburg 1936) The evidence for any direct action on the platelets the endothelium or the coagulation mechanism *in vivo* is not convincing and it is probable that any lessening of the morbid haemorrhage of jaundice results from the ability of calcium salts to neutralize the effects of cholaemia (Minot and Cutler 1928) There is now some hope that this confusion may be clarified by the work of Schiff and Hirschberger (1937) who claim to have increased the platelets in normal and thrombocytopenic children by the administration of a fat soluble factor that is different from vitamins A and D This substance which they have called vitamin T, is present in egg yolk and oil of sesame but not in cod liver oil and olive oil They suggest that effects have been attributed to vitamins A and D which were really due to the

solvents in which they were administered These claims should be readily susceptible of proof or disproof

It is now the duty of clinical research workers to test on human patients the permeability vitamin flavon, the coagulation vitamin K, and the thrombocyte vitamin T It is much to be hoped that a higher standard will be attained in tests of this kind than was shown in the advocacy of oestrin, liver extract, and vitamin C for haemophilia and purpura haemorrhagica Acute cases are rarely suitable, as they so rapidly recover spontaneously and it is hard to obtain numbers large enough for proper controls Chronic cases of a well-defined type are much better, and they should preferably be idiopathic and not symptomatic in origin There should be an adequate period of observation before treatment is begun The isolation of insulin was largely due to the development of simple methods of estimating the blood sugar, and the application of liver therapy was much helped by the use of the reticulocyte crisis In the same way objective criteria should be used in assessing the value of remedies for the haemorrhagic states—the number of platelets, the capillary resistance, the bleeding time and coagulation time, the retraction of the clot, and in special cases the plasma proteins, fibrinogen and prothrombin

Summary

1 Hereditary haemorrhagic states show considerable diversity in symptoms and mode of inheritance

2 The local application of coagulant venoms is the only considerable advance of recent years in the treatment of the haemorrhagic diseases The value of liver, oestrin, moccasin venom, and the Sheffield extract of egg albumen has not been confirmed

3 Splenectomy remains the most successful treatment for idiopathic thrombocytopenic purpura, but the frequency of relapses suggests that the operation is a temporary stimulus to platelet production rather than a specific cure for the disease

4 Vitamin C is of value only in scurvy, whether overt or latent It is not a general or non specific remedy for haemorrhagic states Nevertheless the isolation of ascorbic acid is of especial importance, as it marks the impact of biochemistry on the haemorrhagic states and a probable improvement in the technique of investigation

I am indebted to Messrs Hoffmann-La Roche for generous supplies of ascorbic acid and sodium ascorbate to Dr H E. Archer for many estimations of vitamin C in the urine and to the Medical Research Council for a grant for technical assistance

THE CLINICAL PATHOLOGY OF HAEMORRHAGIC STATES *

BY

S C DYKE, D M, F R C P

Pathologist The Royal Hospital Wolverhampton

The development of the haemorrhagic state depends upon the escape of the red cells through the unbroken capillary wall, it may result from various causes For the determination of the prognosis and the initiation of appropriate treatment accurate diagnosis is desirable In none of the haemorrhagic states can this be made without the assistance of laboratory methods, in few of them, however, can it be established by laboratory methods alone Usually it calls for the intelligent consideration of both laboratory and clinical data

The first step in the laboratory investigation of any case of the haemorrhagic state will consist in the examination of the blood picture This as usually understood comprises an estimation of the haemoglobin percentage, an enumeration of the red and white cells of the blood, a differential count of the white cells, and a report on the morphological characteristics of the formed elements of the blood—the red and white cells and the platelets For the satisfactory investigation of the blood picture it is highly desirable that the specimens for each of the examinations mentioned should be taken in the appropriate manner straight from the patient. Preparations made from specimens of blood collected for transmission into oxalate or any other anti coagulant are usually unsatisfactory and often are quite useless

Bleeding Time

In the act of taking the specimen of the blood valuable information may be gained as to the bleeding time No satisfactory quantitative method exists for this determination Using a large-sized, bayonet-pointed surgical needle and making the puncture after slight massage in the lobe of the ear, the bleeding normally stops well within a minute, usually it is necessary to use a little force to express drops of blood after the first two or three minutes If after the first two or three drops the blood continues to exude the bleeding time may be taken to be prolonged In certain cases associated with gross platelet deficiency, such as thrombopenic purpura (purpura haemorrhagica), aplastic anaemia, and lymphatic leukaemia, the bleeding from a simple puncture may persist for many minutes—if unchecked, even for hours

* Communicated to the Sections of Pathology, Bacteriology, and Immunology and Medicine at the Annual Meeting of the British Medical Association, Belfast 1937

PRACTICES

WANTED PRACTICE £900-£1 100 WITHIN 40 miles of London Panel of at least 800 preferred House with garden desired Capital available—Address No 4601 B M A House Tavistock Square W C 1

BRISTOL —MIXED PRACTICE WITH PLENTY of scope Good panel £1 360 p.a. Price £ 00 House rent—THE WESTERN MEDICAL AGENCY 4 Clare Street Bristol 1 (Bristol 24689) and 15 Bedford Street Strand W C 2 (Temple Bar 453)

FOR SALE —OLD-ESTABLISHED PRACTICE in Sheffield Audited cash receipts £1 050 including £650 from panel Expenses low No branches Plenty of scope if desired Premium £ 000 cash Free house rent or purchase— No 310 B M A House Tavistock Sq W C 1

GENERAL PRACTICE ESTABLISHED thirty-seven years absolutely private could easily be doubled Western Glasgow no mid wives no societies almost no night work Good house main road —Address No 251 B M A House Tavistock Square W C 1

LANCS INDUSTRIAL TOWN MIXED PRACTICE for sale Income averages £1 050 per annum Panel 915 Appointment £75 p.a Good house (with surgery and garage) on lease Rental £70 per annum Premium for quick sale 11 years purchase—Address No 618 B M A House Tavistock Square W C 1

APPOINTMENTS —Contd

PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY

The Board of Management invite applications from unmarried persons for the following posts which become vacant on January 1st 1937

HOUSE SURGEON duties in Male Female and Children's Wards under Consulting Surgeon

This post is recognized as approved experience in connection with the Examination for the F R C S (Eng.) degree

HOUSE PHYSICIAN duties in Male Female and Children's Medical Wards

Salary in each case at the rate of £150 per annum with board residence and laundry Six months appointment

Total Resident Staff 8

Applications stating age qualifications and experience, together with copy testimonials to be forwarded to the undersigned as soon as possible

Royal Infirmary JOHN GIBSON
Preston Superintendent and Secretary
December 14th 1937

WEST SUSSEX COUNTY MENTAL HOSPITAL, CHICHESTER

Applications are invited from gentlemen under the age of 35 year for the post of THIRD ASSISTANT MEDICAL OFFICER at the above Hospital Salary £350 rising by annual increments of £ 5 to £4 0 per annum together with board lodging etc and for superannuation purposes at £150 An additional £.0 per annum will be given to the successful candidate if he holds or obtains his diploma in Psychological Medicine The appointment is subject to the provisions of the Asylums Officers Superannuation Act 1924

Applications stating age and experience together with copies of not more than three recent testimonials to be sent on or before January 7th 1938 to the Medical Superintendent

BRIGHTON COUNTY BOROUGH MENTAL HOSPITAL, Haywards Heath Sussex

APPOINTMENT OF THIRD ASSISTANT MEDICAL OFFICER

The Visiting Committee are prepared to receive applications from medical men for the above post No married quarters are provided

The salary will be £350 per annum rising by annual increments of £25 to £450 per annum with a further £50 per annum if in possession of the D P M

The age of the candidate should not exceed 35 Furnished apartments will be provided with board and laundry valued for superannuation purposes at £100 per annum

Candidates must be registered under the Medical Act and preference will be given to those who have held the post of House Surgeon or House Physician at a General Hospital The appointment will be subject to the provisions of the Asylums Officers Superannuation Act 1909

Applications with copies (not originals) of three recent testimonials to be sent to the Medical Superintendent at the above Hospital and to be received by January 7th 1938

ROYAL MANCHESTER CHILDREN'S HOSPITAL PENDLEBURY

Applications are invited for the post of non-resident ASSISTANT MEDICAL OFFICER at the Out patients Department Garside Street Manchester Salary at the rate of £150 per annum and the appointment is for a period of six months as from January 15th 1938 Candidates must be on the Medical Register

Particulars of duties can be obtained from the Secretary The hours of duty are from 9 a m till 1 p.m or until the work of the Dispensary is finished Patients attendances number about 100 000 per annum

Applications stating age and accompanied by copies of not more than three testimonials, to be sent to the undersigned immediately

Canvassing directly or indirectly may disqualify

By Order
H HEARDMAN
Secretary

PEAMOUNT SANATORIUM NEWCASTLE Co DUBLIN

Applications are invited from unmarried male Medical Practitioners for the post of ASSISTANT MEDICAL SUPERINTENDENT to the above Sanatorium

Commencing salary at the rate of £300 per annum with furnished apartments board laundry and attendance

The appointment is for one year subject to renewal

Preference will be given to applicants who have had experience in the treatment of Pulmonary Tuberculosis

Applicants to state age details of qualifications as well as of general and special experience

Applications with copies of three recent testimonials should be addressed to the Chairman and forwarded so as to reach 9 Ely Place Dublin by January 15th 1938

GLASGOW ROYAL INFIRMARY

RESIDENT MEDICAL OFFICER required at Cannisburn Auxiliary Hospital Salary at the rate of £200 per annum with board lodging and washing

Applicants with previous hospital resident experience preferred

Applications with three copies of recent testimonials, to be lodged by December 27th with the Superintendent Glasgow Royal Infirmary from whom further particulars can be obtained Not canvassing

J M GRANT
Superintendent Glasgow Royal Infirmary
December 14th 1937

LINCOLN COUNTY HOSPITAL

Wanted SENIOR HOUSE SURGEON male unmarried Salary at the rate of £2.0 per annum rising to £300 per annum at the conclusion of six months approved service Board residence and washing will also be provided

Applications stating age and other particulars with copies of not more than three testimonials to be sent to the undersigned from whom further particulars may be obtained

ARTHUR MOORE
Lincoln Secretary Superintendent
November 27th 1937

THE ROYAL INFIRMARY SHEFFIELD (750 Beds)

The Board of Management invite applications for the post of SENIOR CASUALTY OFFICER

The salary attached to the post is £1 0 per annum with board and residence The appointment will be terminable at the period of three months from January 1st 1938 The person next in seniority to that of Resident Surgical Officer

Applications with copies of testimonials to be sent to the General Superintendent not later than 1st February

December 15 1937

the blood no longer flows from its position but maintains its surface contour' It is important that the tubes be not stoppered, this decreases the coagulation time The originators placed the normal limits as from five to eight minutes I should be inclined to extend the upper limit of normal to ten minutes

In addition the coagulation time varies inversely with temperature, Dale and Laidlaw showed that this acceleration of clotting is much more rapid at temperatures of over 25° C than below For practical purposes, in the temperate zone the test of Lee and White may be carried out at room temperature Accurate estimation of the coagulation time is of great importance in the investigation of suspected haemophilia The history, both personal and family, provides valuable information, but it is the prolongation of the clotting time that clinches the diagnosis

Post-operative Haemorrhage

Estimation of the coagulation time is of particular importance when surgery is in prospect In cases of haemophilia, when in the course of a natural remission or after blood transfusion the coagulation time by the method of Lee and White has been brought down to twelve minutes, the risk of serious and uncontrollable haemorrhage at operation is negligible

In cases of jaundice, other than those of the acholuric type associated with haemolysis, the coagulation time may be prolonged, and its estimation will give valuable information as to the risk of post-operative haemorrhage A delay in the coagulation time of anything over fifteen minutes by the method of Lee and White indicates the likelihood of inefficient natural haemostasis The serum calcium in these cases of obstructive or overflow jaundice is not as a rule diminished, and may even be somewhat increased, but that this tendency to uncontrollable haemorrhage is associated with a shortage in the blood of calcium ions available for the clotting process may be demonstrated by the calcium *in vitro* test" of Lee and Vincent (1914) This consists in adding three drops of 1 per cent $CaCl_2$ solution to 1 c cm of freshly drawn blood In blood in which delay of coagulation is due to the presence of bile salts this procedure brings about a marked diminution of the clotting time In cases in which the delay is due to other causes it is without effect In this type of case both blood transfusion and the parenteral injection of calcium salts, for which purpose many excellent preparations are now available, will quickly bring about the disappearance of haemorrhagic manifestations and reduce the clotting time to normal Once this has been done there need be no fear of unusual post operative bleeding

It is important in all cases of jaundice to bear in mind that the tendency to bleeding and the delay of the coagulation time may not depend solely on deficiency of available calcium ions In certain cases of gross hepatic disturbance, such as are met with in phosphorus or chloroform poisoning or in acute yellow atrophy or cirrhosis of the liver, interference with fibrin formation may occur In such cases the coagulation time may be normal, but the clot when formed will be of poor quality, severe post-operative bleeding may then take place despite a normal clotting time, and little can be done to remedy matters

Nephritis

In nephritis the haemorrhagic state may develop and may prove extremely troublesome It is not an early manifestation, but may present itself in the middle or later stages of subacute glomerulonephritis In such cases there may be epistaxis, bleeding from the gums and a tendency to easy bruising, but purpura does not occur Examination of the blood picture will show a simple anaemia only, pointers to the diagnosis will be found in a raised blood pressure and albuminuria The blood urea may or may not show significant increase at this stage, but the van Slyke urea-clearance test will already show gross impairment of renal function These haemorrhagic manifestations are of very grave significance, but the ultimate fatal issue may be postponed for months and even for years after their appearance In the later stages of chronic nephritis of the arteriolosclerotic type manifestations of the same symptoms in a much more severe form and with actual purpura may arise, haemorrhage from the nose or bowel stomach or uterus, may be profuse and intractable Those fulminating manifestations are terminal, the blood urea at this stage will be found to be at a level of 300 mg per 100 c cm or more, and death is not long postponed

It is tempting to associate these haemorrhages with the lowering of the serum calcium, which is invariable in the developed uraemic state In the earlier type of case, however, the serum calcium is not found to be diminished and neither in those cases nor in the later terminal state in which the serum calcium is grossly below normal do parenteral injections of calcium have the same effect as in haemorrhage associated with jaundice

The haemorrhagic state may present itself in the course of many acute infections and septic conditions In these cases its establishment appears to be due to damage sustained by the capillary walls as a result of the infection The differentiation of cases having an infective basis from those mentioned above seldom presents any great difficulty their clinical pathology is that of the causative infection

In 1936 Sir John Orr published a study showing how the consumption of certain essential foods, including milk, varies with income, and the conclusion has become widespread that lack of purchasing power is the sole obstacle to increased consumption A pamphlet entitled *Milk Consumption* by K A H Murray, and issued at 2s 6d by the Agricultural Economics Research Institute, Parks Road, Oxford summarizes existing knowledge of the factors which affect the rate of milk consumption, such as price, income, size of household, and numbers of children It goes on then to suggest, however, that little indication has been given of the relative importance of these factors, and that other influences of equal if not of greater importance have been neglected The second section of the study describes a survey of milk consumption and utilization in Oxford which was designed to fill in some of the gaps in the existing knowledge, particularly the influence of factors such as habit and taste The evidence presented indicates that while one of the difficulties in the way of increasing milk consumption is lack of purchasing power, possibly the biggest obstacles are antipathy, indifference and prejudice The general conclusion is that there is more hope of raising milk consumption by means of extensive advertisement and education than by raising incomes or lowering prices

THE HOSPITAL FOR SICK CHILDREN
Great Ormond Street, London W C 1

Applications are invited for the post of ASSISTANT PATHOLOGIST (male)

Candidates who must possess a legal qualification to practise are required to send in their applications addressed to the Secretary accompanied *by copies of not more than three* testimonials given specially for the purpose before 12 o clock on Monday January 3rd 1938

The appointment is for one year and is non resident Salary £400 per annum, with facilities for Private Pathological Practice

The selected candidate will be required to take up his duties not later than February 16th 1938 preferably earlier

All candidates must be in attendance to appear before the Joint Committee on Wednesday January 5th 1938 at 4 45 p m

Forms of application copy of the rules and details of the appointment will be supplied on application to the undersigned

60 Grove End Road N W 8

Applications are invited for the post of RESIDENT HOUSE PHYSICIAN (male) The post is recognized for the degree of M D London University The appointment will be for six months from February 1st, 1938 Salary at the rate of £100 per annum with full board Applications together with copies of three testimonials should reach the undersigned by January 3rd 1938

Applicants will be required to attend a meeting of the Medical Committee at 8 30 p m on January 4th at the Hospital

F DUDLEY HOBBS B A
Secretary

KING EDWARD MEMORIAL HOSPITAL
Ealing (145 Beds)

CASUALTY OFFICER AND DEPUTY RESIDENT MEDICAL OFFICER (male) required for February 1st 1938 Six months appointment with possibility of re-election for a further period Salary £225 per annum with usual residential emoluments

Applications stating age experience, and qualifications together with copies of two recent testimonials should be sent to the undersigned by January 6th 1938

R A MICKELWRIGHT
House Governor

ST JOHN S HOSPITAL FOR DISEASES OF THE SKIN
5 Lisle Street Leicester Square W C 2.

Applications for the post of OUT PATIENT MEDICAL REGISTRAR are invited to be sent to the undersigned on or before Saturday morning January 1st, 1938 Honorarium £50 per annum Applicants must be duly qualified and registered Medical Practitioners Particulars of the duties can be obtained on application

LEONARD G R TURPIN
December 16th 1937 Secretary

KING GEORGE HOSPITAL ILFORD
(Nr London) (207 Beds)

CASUALTY OFFICER AND SURGICAL REGISTRAR (male) required immediately for 12 months Salary £150 p a Forms of application may be obtained from the undersigned to whom they should be returned duly completed as soon as possible

G AUSTIN HEPWORTH
Secretary and Superintendent

ST GEORGE S HOSPITAL SW1

HOUSE PHYSICIAN (male) required for Children s Department Appointment is for six months from January 15th 1938 Resident with salary at the rate of £40 p a Preference will be given to candidates with previous experience of Children s Diseases

Applications to the Secretary not later than December 31st.

J M CHURCHFIELD
Secretary

WEST HAM MENTAL HOSPITAL
Goodmayes Ilford Essex

Applications are invited for Two Male JUNIOR ASSISTANT MEDICAL OFFICERS at the above Hospital Candidates must be unmarried

The commencing salary in both cases is at the rate of £350 per annum rising by annual increments of £25 to a maximum of £450 per annum together with emoluments consisting of board laundry and attendance valued for superannuation purposes at £150 per annum The persons appointed will also be paid in addition to their salary the sum of £50 per annum on obtaining the Diploma of Psychological Medicine. The appointments are subject to six months probation and to the provisions of the Asylums Officers Superannuation Act 1909 Class 1 and to a satisfactory medical examination A knowledge of bacteriological work will be an advantage

Applications stating age and experience accompanied by copies of three testimonials must reach the Medical Superintendent not later than January 3rd 1938

ROYAL WEST SUSSEX HOSPITAL
Chichester

The Board of Management invites applications for the appointment of HONORARY PHYSICIAN to fill the vacancy caused by the retirement of an Honorary Physician

Candidates must be duly registered under the Medical Acts and a graduate in Medicine of a University recognized by the General Medical Council or a Member of the Royal College of Physicians London Edinburgh or Ireland

The vacancy will be filled by the Special Election Committee at a meeting to be held on January 17th 1938 and applications should be sent to the Chairman of the Hospital (marked personal) together with copies of three testimonials not later than January 10th 1938

Canvassing directly or indirectly will disqualify

By Order of the Board of Management
ALAN RUDDIE
December 8th 1937 Secretary

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST BROMPTON S W 3

The Committee of Management invite applications for the following posts

HOUSE PHYSICIAN for which there are three vacancies The duties include work in the Out patient Department as well as in the Wards The appointment is for six months commencing February 1st 1938 with an honorarium of £50

HOUSE PHYSICIAN (male) at the SANATORIUM at Frimley The appointment is for six months commencing February 1st 1938 with an honorarium of £50

Applications with copies of testimonials must reach the undersigned not later than Saturday January 8th 1938

F G ROUVRAY
Brompton Secretary
December 1937

ROYAL FREE HOSPITAL,
Gray s Inn Road London W C 1

Applications are invited from Medical women who have had extensive V D experience for the part time appointment of MEDICAL OFFICER IN CHARGE of the VENEREAL DISEASES DEPARTMENT for Females at the above-named Hospital as from April 1st 1938 tenable in the first place for one year Minimum salary £450 per annum. The candidate appointed would be responsible for the teaching in the department of medical students and for a postgraduate course Intending candidates should submit applications stating age and experience, with copies of three recent testimonials to the undersigned on or before January 31st, 1938.

RICHARD T BARTLEY
Secretary

ROYAL FREE HOSPITAL
Gray s Inn Road W C 1

Applications are invited for the half time post of GYNAECOLOGICAL REGISTRAR from duly qualified and registered medical women This post is reserved for former students of the London (Royal Free Hospital) School of Medicine for Women Salary £100 per annum Applications stating age and accompanied by copies of three recent testimonials must be sent to the undersigned (from whom all information may be obtained) on or before January 8th Period of appointment February 1st 1938-December 31st 1938

RICHARD T BARTLEY
Secretary

ROYAL FREE HOSPITAL
Gray s Inn Road W C 1

Applications are invited for the whole time post of MEDICAL REGISTRAR Salary £200 per annum Intending candidates who must be fully qualified and registered should submit applications stating age and accompanied by copies of three recent testimonials to the undersigned (from whom all information may be obtained) on or before January 8th Period of appointment February 1st 1938-December 31st, 1938

RICHARD T BARTLEY
Secretary

WEST LONDON HOSPITAL,
Hammersmith Road W 6
(239 Beds)

There is a vacancy for the post of PHYSICIAN for MEDICAL DISEASES OF CHILDREN Candidates who may be male or female must have Degrees from one of the Universities recognised by the General Medical Council and must be Fellows or Members of the Royal College of Physicians of London The successful candidate will be required in addition to other duties periodically to deliver courses of lectures to the Nurses and to undertake such teaching for the Postgraduate College as the Board may approve.

Applications with copies only of testimonials must reach me not later than Thursday January 6th Candidates must attend the Meeting of the Medical Council at 4.30 p m on Friday January 7th and prior to that date call upon and send copies of their application and testimonials to each member thereof They must not canvass members of the Board but nevertheless must send copies of their application and testimonials to each member thereof and if so notified attend a Meeting of the Board at 5 p.m on Tuesday January 11th when the election will be made

H A MADGE,
Secretary

WEST LONDON HOSPITAL,
Hammersmith W 6 (239 Beds)

Applications are invited for the post of HONORARY OPHTHALMIC SURGEON for which the present Honorary Assistant Ophthalmic Surgeon is a candidate In the event of his election there will be a vacancy for a HONORARY ASSISTANT OPHTHALMIC SURGEON for which post applications are also invited

Candidates must be Fellows of one of the Royal Colleges of Surgeons of England Edinburgh or Ireland The successful candidate will be required in addition to his other duties to undertake such teaching for the Postgraduate College as the Board may approve

Applications, with copies only of testimonials must reach me not later than Thursday January 20th Candidates must attend a meeting of the Medical Council at 4 30 p.m on Friday January 21st and prior to that date call upon and send copies of application and testimonials to each member thereof They must not canvass members of the Board but nevertheless must send copies of their application and testimonials to each member thereof and if so notified be in attendance at a meeting of the Board of Management at 5 p m on Tuesday January 25th when the election will be made.

Streptococcal Infection of Birth Canal and Adjacent Tissues

Table I (*b*) shows that so long as the haemolytic streptococcus is confined to the birth canal there is practically no mortality in either group, and Table I (*c*) illustrates that even when the infection has spread to surrounding pelvic and lower abdominal tissues the patient almost invariably recovers, provided that widespread dissemination by the blood stream or by spread all over the peritoneal cavity does not occur (The one death in the 1936–7 group which occurred in the absence of general peritonitis or septicaemia was due to a pulmonary embolus) For proof that the infection has spread beyond the limits of the birth canal (apart from proved septicaemia or generalized peritonitis) reliance has been placed on the finding of a definite inflammatory mass in the pelvis or abdomen, and only cases in which such a mass has been demonstrated either clinically or at post-mortem examination have been classified under this heading

These figures—Table I (*c*)—show that the haemolytic streptococcus is "virulent' only in so far as it is invasive, and that a very large amount of tissue can be infected without causing death from absorption of toxins In comparing the two groups of patients it will be noted that in the 1934–5 group the infection was clinically limited to the birth canal in only 47 per cent of the cases In the 1936–7 group the infection was clinically limited to the birth canal in 66 per cent This may be interpreted in one of two ways Either the prevalent haemolytic streptococcus of 1936–7 was less invasive—that is, less virulent —than that of 1934–5 or else the chemotherapy of 1936–7 helped to prevent the invasion of tissues around the birth canal

In many cases of localized spread of infection beyond the limits of the birth canal it is difficult to say precisely when a definite inflammatory mass was demonstrated clinically a 'sense of resistance may give place to a 'thickening,' and it may not be until several days later that an obvious 'lump is found In spite of this difficulty an attempt has been made to give a figure indicating the proportion of cases in which an inflammatory mass developed after admission to hospital—that is, after the institution of treatment In the 1934–5 series forty-one of the patients (20 per cent) had a demonstrable inflammatory mass on admission to hospital, and an additional twenty-nine patients (14 per cent) developed a mass some time after admission In the 1936–7 series an inflammatory mass was found in twenty-seven patients (17 per cent) on admission to hospital, and in nine* patients (6 per cent) a similar mass developed after admission There was therefore a notable reduction in the proportion of cases in which an obvious spread of infection occurred after admission to hospital in the period when the new drugs were employed This may be evidence of the efficacy of the new chemotherapy, or, alternatively, it may be explained on the grounds that the virulence of the haemolytic streptococcus was diminished in the 1936–7 period

Mortality Rates in Septicaemia

Table I (*d*) shows the mortality rates in proven septicaemia (excluding cases in which general peritonitis was also proved) It was 40 per cent in the group of patients who did not receive the new drugs Even 40 per cent may seem to be a surprisingly low mortality for blood-positive septicaemias due to the haemolytic streptococcus,† but in explanation of this I think that the care with which the bacteriological technique is carried out must be a factor in giving an (apparently) low mortality rate for cases in this class If a less careful technique had been employed it is probable that some of the less severe septicaemias would not have been detected, so that although the total number would have been less the mortality rate would have been higher This factor is of no importance in comparing the results in the two groups under review, because the technique of blood culture was identical in both In the 1936–7 group the mortality for cases of proven septicaemia (excluding cases in which general peritonitis was also present) was 20 per cent, but before trying to assess the significance of this improvement it is useful to try to measure the severity of the cases in the two groups Dr Colebrook and his co workers have, as a routine, estimated the number of organisms per cubic centimetre in the blood in cases of septicaemia, and as a general rule the clinically milder cases are associated with a lower count than the more severe The records of these counts are not strictly comparable between various patients, because the number of organisms in the blood may vary greatly in different stages of the disease, and because blood cultures may be repeated more often in some patients than in others Very roughly speaking, however, if the records show that a count of less than 10 organisms per c cm has not been exceeded at any time during the stage of pyrexia the septicaemia is probably 'mild' The records of the cases at Queen Charlotte s Hospital show that the lower mortality from septicaemia in the 1936–7 period was associated with a relative increase in the proportion of 'mild cases, in comparison with the 1934–5 period This diminished invasion of the blood stream in the 1936–7 period is what we might expect to find if the new drugs were effective in checking the invasiveness of the haemolytic streptococcus, but, alternatively, a falling off in the virulence of the prevalent haemolytic streptococcus of 1936–7 would also manifest itself in the same way

In the 1934–5 group a positive blood culture was obtained within twenty-four hours of admission in thirty one cases (15 per cent) of all cases infected with the haemolytic streptococcus In the 1936–7 group the corresponding figure was twenty two (14 per cent) In the 1934–5 group ten cases (5 per cent) developed a septicaemia some time after admission In the 1936–7 group only one patient developed a septicaemia (and in this case the first blood culture was not taken until several days after admission) The incidence of septicaemia before admission does not greatly differ in the two groups, and this is some evidence that there was not any considerable difference in the invasiveness (virulence) of the prevalent streptococcus in the two periods If this is so the diminished incidence of septicaemia developing after treatment with the new drugs is some evidence that the good results are due to the drugs rather than to a hypothetical decrease in the virulence of the infecting organism

Generalized and Generalizing Peritonitis

Table I (*e*) and (*f*) gives the results when "generalized' and 'generalizing' peritonitis occurred, but there are good reasons for exercising very great caution in interpreting these figures The outcome of any peritoneal infection depends upon whether the tendency of the tissues to localize the infection overcomes the tendency

* Among these nine patients in the 1936–7 group there were four who did not receive any treatment by the new drugs so that by excluding the four cases there were only five (3.2 per cent) who developed a demonstrable mass after treatment with the new drugs

† If the results for four years (1932–5) are analysed the mortality at Queen Charlotte s was 47 per cent

THE MEDICAL AGENCY, Ltd

DUDLEY HOUSE, 36-38 SOUTHAMPTON ST., STRAND W.C.2

Telephone—Temple Bar 1054 *Established in 1893 by J. A. REASBE.*

LONDON N.—Old-established middle-class PRACTICE in residential locality. S.D. house to rent. Receipts £600 p.a. Panel 150—recently started. Fees 3/6 up. Premium £900.

NO CHARGE TO PURCHASERS.
FINANCIAL ASSISTANCE ARRANGED.

ASSISTANTS—VACANCIES IN TOWN and Country, Indoor and Outdoor. List on application.

been able to find that disallows the alternative explanation that the improvement in results was due not to the treatment but to a fortuitous change in the virulence of the prevalent streptococcus There are, however, two reasons for questioning the value of these diagrams In the first place they refer to only small numbers of patients (fifty-six in 1934–5 and thirty-two in 1936–7), so that statistically they are open to criticism In the second place, although I consider that invasion of tissues is the best possible clinical measure of virulence in haemolytic streptococcal infections, it is not possible to assert that the tissues were equally widely invaded in the two groups concerned Great care has been taken to include only those patients in whom a definite inflammatory mass was demonstrated, but it is just possible that the average size of the mass was considerably greater in the 1934–5 series than in the 1936–7 series If this were so it might be evidence of a minor variation in virulence of the streptococcus in the two series No further analysis on these lines has been attempted, because it would incur the possibility of statistical and observational errors so great as to negative any results

Conclusions

The new aniline derivatives have been employed at Queen Charlotte s Hospital since 1936, in the doses in which they have been given their use appears to be free from serious danger and has been followed by a very great reduction in the mortality rate for haemolytic streptococcal infections Analysis of the causes of this improvement in mortality rate shows that it is associated mainly with a decrease in the widespread invasion of tissues by the haemolytic streptococcus rather than with a greater tendency to resolution of the disease once widespread invasion of tissues has occurred This feature makes it necessary to consider whether the improvement since January, 1936, is due to the efficacy of the treatment or whether it is due to a change in the virulence of the prevalent organism It is possible that both factors may be concerned In non-fatal cases in which tissues beyond the limits of the birth canal have been invaded by the haemolytic streptococcus there is some clinical evidence that the new drugs do actually hasten the resolution of the inflammatory process, and this is a good reason for believing that the treatment, rather than a change in the virulence of the organism, is responsible for the improvement in this direction

While I am unwilling to guess how far the new drugs have been responsible for the undoubted improvement which has followed their clinical use, there is every reason to continue to employ them until their value or otherwise is firmly established

OTITIS EXTERNA*

BY

L. GRAHAM BROWN, M D, F R C S

Surgeon to the Ear Nose and Throat Department Charing Cross Hospital

By this term otologists refer to certain types of inflammatory lesion of the external auditory canal These are all infections of the skin lining the canal Since, however, this skin is directly continuous with that covering the auricle and surrounding parts, obviously the infections need not always originate in or be confined solely to the anatomical boundaries of the canal Therefore, in discussing their aetiology and treatment we should not limit ourselves too strictly to this part of the external ear

Aetiology

As a cause of the lesion the most important factor is naturally the invading organism or virus Those of external origin give rise to the commoner types of eruption and include the pityrosporon, acne bacillus, *Staphylococcus albus* *Staphylococcus aureus* and *Streptococcus longus* The rarer forms may be due to various fungi, especially those of the aspergillus variety to the *Bacillus pyocyaneus* the bacillus of diphtheria, Plaut Vincent s organism, and very occasionally the tubercle bacillus On the other hand, the infective organism or virus may reach the skin of the ear by way of the blood stream, producing eruptions that can be recognized as exanthematous, syphilitic, or influenzal

Their location, and in the case of organisms their site of growth in the various structures of the skin bring about defence reactions which in turn determine different characteristics in the form of the lesions The defence reactions include the usual phenomena of inflammation—for example hyperaemia, oedema, exudation of leucocytes, etc—but to these must be added another very important one—namely, the so called eczematous reaction, which it is agreed always indicates cell sensitization As to the relation of this reaction to that of true eczema opinion is still divided but we may assume that for clinical purposes the results of both are much the same With regard to the site of growth we find that certain organisms appear to have a special predilection for definite structures of the skin For example, the pityrosporon and the aspergillus confine themselves chiefly to the stratum corneum, the *Streptococcus longus* to the deeper layers of the epidermis, even extending to the dermis, whilst the acne bacillus, *Staphylococcus albus* and *Staphylococcus aureus* favour the pilo sebaceous follicle In turn the defence reactions of the epidermis to the first group of above-mentioned micro organisms may result in such clinical manifestations as a simple scaliness or dandruff, a more intensive desquamation, or as a definite cuticular inflammation, primarily perifollicular, so that the affected part takes on the appearance of a seborrhoeic dermatitis When the deeper layers of the epidermis are invaded by the *Streptococcus longus* the resulting lesion may then be the subcorneal vesicle of impetigo the streptococcal fissure or the ecthymatous ulcer Finally one must mention the defence reactions of the pilo sebaceous follicle to invasion by the acne bacillus, and *Staphylococcus albus* and *aureus* a group of organisms referred to by some dermatologists as the seborrhoeic triad Of this group the *Staphylococcus aureus*

The Association has long been favourably known to the members of the Medical Profession as a thoroughly trustworthy and successful agency for the transaction of every description of Medical Scholastic and Accountancy business and the BRITISH MEDICAL ASSOCIATION has every confidence in recommending its members to consult The Manager in all transactions requiring the services of a Medical Agent.
Members of the British Medical Association may take advantage of a reduced scale of charges applicable to them.

REDUCTION IN FEES

In cases where the Bureau are sole Agents the commission in respect of any sale of goodwill book debts furniture drugs fittings and other effects (excluding sales of any freehold or leasehold property or of practices, effects etc, outside Great Britain) is limited to a maximum fee of Fifty Pounds

FULL TERMS ON APPLICATION

Practices and Partnerships for Disposal. **Full Particulars sent free.**

1 SE LONDON—Old-established middle and working-class non panel PRACTICE averaging £1 730 p.a including appointments worth about £100 Good house (5 bedrooms) garage and fair sized garden to rent Scope Premium one and a half years purchase

2 INDUSTRIAL TOWN in the WEST OF ENGLAND—Old-established and steadily increasing PRACTICE, averaging over £1 800 p.a Panel about 560 House to rent Premium £1 600

3 LONDON, S E—Medical Woman's PRACTICE, doing about £300 p.a in suburban district No panel Plenty of scope Semi-detached corner house Price £750 or might be let Could be increased by one giving more time to practice Premium one and a half years' purchase

4 S W OF ENGLAND—Country PRACTICE averaging £2,500 p.a, easy distance of coast (appointments and panel return about £650 p.a) Large house (3 reception 6 bedrooms etc) in grounds of four acres including orchard Price £3,200 Hunting golf, etc. Premium one and three quarter years purchase

5 W OF ENGLAND—Old established middle-class PRACTICE, about £1 400 p.a, in good town Selected panel about 300 Visits 5/ to £1 1s medicine extra Very convenient and well situated detached non basement house (7 bedrooms), with nice garden and large garage to rent Premium one and a half years purchase

6 LONDON, N W—Increasing PRACTICE in growing residential district, about 10 miles from Marble Arch Receipts last twelve months £720 Panel 200 Detached Georgian house (5 bedrooms, etc) garage and garden Price £2 900 (part on mortgage) Very good scope Premium £850

7 WESTERN AUSTRALIA—Non-dispensing PRACTICE in chiefly dairy farming district Receipts average £1 815 p.a House containing 6 main rooms etc, and about four acres of grounds Price £1 000 cash or rent £100 p.a Excellent climate District rapidly progressing. Local hospital Premium £1,250

8 MIDDLESEX—PRACTICE in growing district about twelve miles from London Receipts past twelve months, £463 Panel 244 Semi-detached house (4 bedrooms) with garage and garden Rent £100 p.a Good scope Premium £900

9 S OF ENGLAND, Important Town.—PRACTICE averaging £1 000 p.a exclusively physio-therapy Fees 10/6 to £1 1s Scope for X-ray work Prospect of appointment on hospital staff Premium to include certain equipment £1 250

10 EASTERN COUNTIES—Country PRACTICE averaging £1 750 p.a., within easy distance of county town Panel 1 070 Good house (in 2¼ acres) with 7 bedrooms etc garage company's water and main drainage Price £2 000 freehold Premium two years purchase

11 LANCS—Well-established non-panel PRACTICE, averaging over £4 000 p a in manufacturing town House with 5 bedrooms and surgery premises with separate entrance large garage and good garden for sale Price £2,500 freehold Premium £6 000 or near offer

12 S COAST—PARTNERSHIP in mixed PRACTICE averaging £2 800 p a in seaside resort Panel about 2 000 Semi-detached house (5 bedrooms etc) with good garden for sale or rent. Excellent hospital Scope for major surgery. Premium one half share two years purchase

13 W OF ENGLAND Inland Watering Place—Old-established good-class easily worked PRACTICE Receipts past year, £722 No panel Practically non-dispensing House with 6 bedrooms, etc large garage and small garden to rent on lease Premium £1 000

14 LONDON, E 1—Old-established PRACTICE of about £800 p.a, including appointments about £150 p.a and panel 1,300 Good house (6 bedrooms, etc) to rent or purchase. Very good scope for increase Premium £1,800 to include contents of surgery and waiting room etc

15 NORTHERN IRELAND—Middle and working-class PRACTICE in suburb of important seaport Receipts past year £963 Panel nearly 1,200 Well situated house (5 bedrooms), garage, etc, to rent Practice capable of expansion Premium £1 400

16 HOME COUNTY—PARTNERSHIP in country town Practice averaging over £4 000 p.a (increasing) within 25 miles of London Good appointments and panel about 2 000 Suitable house obtainable Incoming partner should be aged about 30 must possess F R C S and have had one year's P G work Good hospital. One fourth share at first at two years purchase

17 MIDLANDS—Unopposed country PRACTICE in very pleasant hunting district. Cash receipts last year £1 097, including good appointments and panel about 500 Well built house (5 bedrooms, etc) with good garden and garage Main electric light and water supply Price £1 100 freehold Golf etc Premium £1 600

18 S COAST, popular seaside resort—Small good middle-class non-dispensing PRACTICE £350/£400 p.a No panel One appointment worth £50 p.a Maisonette (3 bedrooms etc) to rent at £160 p.a Premium £500

19 MIDLANDS—Easily worked PRACTICE in very attractive village about 70 miles from London Cash receipts 1937 (to November 25th) £696 Panel 500 Detached modern house (4 bed and dressing rooms) gas electricity and main drainage garden over an acre Price freehold £1 600 Premium one and three-quarter years purchase to include stock of drugs

20 N WALES—Old-established good-class PRACTICE, which has always averaged over £1,200 a year, in very attractive residential seaside resort. Panel 425 Good house to rent or purchase Pleasant society Premium £1 800

21 AUSTRALIA—PRACTICE in small township in Victoria Receipts last year, £880 Specially built house to rent at £80 p.a Good climate All kinds of sport Premium £500 English currency including drugs and dispensary fittings

22 YORKSHIRE (N R)—Steadi' PRACTICE between £1 400/£1,500 and panel worth £400 p.a Extremely more bedrooms) garage and small garden for sale Good schools and sport Premium one and a half years purchase

23 SURREY—PARTNERSHIP in sound old-established and steadily increasing Practice averaging £4 445 p.a in outlying residential suburban district Panel 2 000 Visits 3/6 to 21/ Suitable house obtainable Premium for share of 11/39ths £2,900

moisture for its growth, and oils and fatty matter form a suitable nidus for its development No doubt this explains why the condition is most frequently met with in tropical and subtropical climates such as that of the Hawaiian Islands

ECZEMATOUS OTITIS EXTERNA

This affection should not be confused with that of true eczema Dermatologists to-day generally agree that the majority of cases of so called eczema of the external auditory meatus are really examples of infective meatitis It has been shown that the eczematous reaction occurs when the tissue cells of the skin become sensitized to any of the infecting micro organisms or their antigens Hence it may superimpose itself upon any of the simple infections such as are produced by the pityrosporon, *Staphylococcus aureus Streptococcus longus* or even the tubercle bacillus Two types can generally be recognized—an acute and a chronic In the former an initial stage of redness, itching swelling and smarting pain is followed by a stage of exudation and crusting The area involved may finally become denuded of its epithelium and present a raw and bleeding surface In the chronic form the appearance of the meatus may vary from a dry scaliness due to exfoliated epithelium to a sclerosis of the skin, leading to great thickening and stenosis of the meatus Here again itchiness is the most prominent symptom, and it leads the patient to cause further irritation by scratching

OTITIS EXTERNA HAEMORRHAGICA

This condition is often seen in patients after an attack of influenza Earache is severe and the onset sudden, as in an acute middle ear infection Otoscopy reveals one or more purple blebs (or blood-filled blisters) situated upon the tympanic membrane or close to it on the meatal walls This as a rule requires little if any local treatment beyond avoidance of a mixed infection

In concluding this part of the subject it may be permissible to mention certain lesions of the auricle and surrounding parts which, although they may occur independently, are very often associated with a diffuse inflammation of the external auditory canal Those which most concern us are perichondritis, erysipelas, impetigo, intertrigo, fissures, and the various eczematous conditions Of these intertrigo and fissures deserve special mention They affect the natural folds and angles of the auricle and are examples usually of a chronic streptococcal invasion often preceded by an infection with the pityrosporon Intertrigo is most frequently seen in the retro auricular fold, whilst fissures are likewise found here and also beneath the lobule and in the angles of the meatal orifice

Treatment

In the treatment of skin infections the three principal measures are (1) cleansing of the affected part as thoroughly as possible, (2) the application of some form of non-irritating germicide, and (3) protection from further irritation and infection In treating a relatively inaccessible region such as the meatus we are necessarily limited in our choice of methods and medicaments In cleansing the meatus I still prefer, in spite of many opinions to the contrary, the old-fashioned method of syringing The simplest and most suitable lotion I have found for this purpose is a warm boric acid solution The softening and hence adverse effect of water upon skin infections especially those of an eczematous nature, can be easily overcome by the subsequent instillation of a few drops of 60 to 70 per cent alcohol, used as a dehydrating agent The latter also acts as a germicide and readily penetrates right down to the fundus of the canal, where ointments obviously cannot be conveniently applied Ointments, however, can be used for the outer portion of the meatus, and here the cotton wound applicator is of most service Protection can be afforded to the meatus very simply either by a pledget of cotton-wool in the region of the concha or by narrow ribbon gauze inserted into the meatus itself The latter, if kept moist with drops, may also serve as a means of applying a continuous antiseptic to the walls of the canal

The choice of a suitable non-irritating germicide presents the most difficult problem in the treatment of all types of otitis externa There is also the personal factor to be considered, a certain germicide being found efficacious in one type of patient but not in another Hence in any individual case we may have to find out by actual practical experience what sort of germicide will produce the best results Of the many ointments suggested preference should be given to those containing a zinc basis Cream of zinc and Lassar's paste I personally have found most useful These act probably more by reason of their protective nature rather than their germicidal qualities Sulphur and mercury ointments more often than not appear to be too irritating When a stimulating ointment is required it will be found convenient to add liquor carbonis detergens (or its successor, liquor picis carbonis) to the zinc preparation When desquamation is present, salicylic acid, 10 grains to the ounce, is essential

Local treatment will also include that of a coexistent lesion of the auricle and surrounding parts, especially an infected scalp, or incision of a furuncle or a diffuse suppurative meatitis, or possibly a retro auricular abscess

As regards general treatment many different methods have been tried, but as yet their true value has not been determined They include vaccine and serum therapy (intradermal or subcutaneous), injections of collosal manganese, stannoxyl etc, various diets (especially in the eczematous affections), treatment of the seborrhoeic patient, light therapy, and x rays Upon their value I can offer no useful opinion beyond the statement that each in turn has proved successful in certain cases but none is really specific in all

---

The new maternity unit of the Southampton General Hospital makes provision for fully one-third of the number of births in the borough taking as a basis the 1933 figure of 2,854 The accommodation comprises forty-two lying-in beds, four pre-labour beds, and three isolation beds, and it is expected that between 900 and 1,000 cases will be admitted each year Preference will be given to patients suffering from abnormalities of pregnancy or labour, to those requiring ante-natal observation, and to those whose domestic conditions are unsatisfactory The unit has been constructed entirely on one floor, permitting the addition of one or even two stories in the future without interference with the existing walls Among modern improvements is a signalling system, whereby red and green lights over the door of the ward and in the duty room inform the nursing staff of the requirements of individual patients and electrical equipment attached to the poison cupboard which operates a red light and a buzzer that come into action immediately the cupboard door is opened and continue until it is closed There is also an incubator with thermostatic control

PROTECTION OF THE SKIN AGAINST LIME

BY

G C PETHER, M D, M R C P.
Group Medical Officer Imperial Chemical Industries (Lime Group)

In the last two years I have had occasion to try various remedies and preventive measures for dealing with burns of the skin and eyes caused by lime The workers in our local industry are engaged in the quarrying of limestone, which is burnt in kilns adjacent to the quarries, various grades and qualities of lime being produced The kilns are fed at the top with limestone, coke, and coal, and the finished lime and debris is withdrawn from apertures at the bottom of the kilns by hand and also with the aid of rakes The lime appears in fragments of all shapes and sizes up to pieces perhaps nine inches through the long diameter and weighing several pounds Skilled workmen are able to detect and remove partly burnt pieces of stone which are known as "bullheads These latter and the "smalls" are dealt with separately, while properly burnt large pieces are sold at the best prices

The various products described are loaded into small trucks, which are later emptied into lorries or railway wagons It is clear that in such procedures large quantities of lime dust and small fragments will be cast into the air These will settle on the clothes and skin and in the eyes of the workmen, and will be both mechanically and chemically irritating In addition, wherever lime comes into contact with moisture the exothermic reaction whereby it is slaked may be sufficiently violent to cause considerable burning I propose at a later date to describe the methods devised for dealing with lime in the eye I will here confine myself to the treatment of the skin

Protective Methods

In the past, various methods have been tried to mitigate the damage caused, and protection against wind and weather has been provided wherever possible Masks are worn to protect the nose, and goggles are available for the eyes Some of the workers, after an initial period of distress, appear to acquire a certain tolerance to the lime, both in the eyes and in other exposed parts, whilst others need protection most of the time A piece of material tied loosely over the mouth and nose satisfies many The protection of the skin itself presents a difficult problem The handling of lime both dries and hardens the skin to a marked degree, and any perspiration inevitably causes a brisk reaction and local burning This risk is also present on wet days when gusts of wind blow rain into the loading platforms

I discovered that many remedies of a fatty nature, such as tallow, lanoline, and olive oil, had been applied to the skin as a protection These are unsuitable, since they cause lime dust to adhere where previously it would have brushed off, and, in addition, they act somewhat as does theatrical grease paint, by checking the cooling of the skin by insensible perspiration As a result small collections of sweat are formed which later react suddenly and violently with the lime In considering these facts I was struck by one factor that appears to have been insufficiently stressed the rate of evolution of heat when lime meets water It is clear that if this reaction can be slowed down sufficiently no burning will occur By a large-scale slaking of lime a temperature of 300° C may easily be attained So far as the skin is concerned the most common lesions, apart from a general hardening thickening, and fissure formation, are small scattered superficial ulcers and more definite burns of larger extent. These, particularly if on the hands and fingers, are very crippling and make work difficult or impossible Infection may be superadded on the original lesions with an impetiginous picture and perhaps more gross and deep-seated infection, particularly if a fissure has been the portal of entry The men employed are reasonably clean and healthy, but even if they wash their hands on leaving work—these are probably as contaminated as ever by the time they have removed their lime-impregnated clothes at home

Use of Talc Powder

Though attention to washing facilities helps considerably, it is yet no protection against the burns and sores caused by the lime To prevent these or diminish their severity I have introduced the use of plain talc powder, which is shaken on the exposed parts from canisters with "pepper-pot' tops This may be repeated several times a day if necessary

Before starting this procedure I envisaged the following results

1 By its well recognized cooling power talc would reduce the temperature of the skin thus diminishing sweating.

2 Any rain or sweat would mix with the powder and form a paste thus reducing the moisture available for reaction with any lime present

3 The paste when dried might form a protective film which would permit lime to make but gradual contact with the skin and its moisture

The three effects described all serve to slow down the reaction between lime and water so that the heat developed is evolved gradually and burning does not occur I have even advised the use of powder for the treatment of the scattered sores already described, and this has often healed them without any other remedy This holds good particularly for the early and relatively uninfected

VITAMIN CONTENT OF FOODS

Vitamin Content of Foods A Summary of the Chemistry of Vitamins Units of Measurement Quantitative Aspects in Human Nutrition and Occurrence in Foods By Esther Peterson Daniel and Hazel E Munsell, United States Department of Agriculture Miscellaneous Publication No 275 1937 obtainable from the Superintendent of Documents Government Printing Office, Washington, D C (Price 15 cents)

This should prove a very valuable book of reference for all those who are concerned, in an intelligent way, with the vitamin content of foods The short description of the chemistry of each vitamin emphasizes the fact that the vitamins are indeed chemical entities and not, as many people believed until a few years ago, merely 'some form of energy' (The displacement of four methyl groups in the formula for β-carotene is regrettable but obviously a printer's error)

It is good to have the account of the International Standards of Reference for vitamin determinations made available to a larger public than would ordinarily have access to it The international units for the measurement of the vitamins will inevitably become more and more widely used Various units were used before the international standards became available, but necessarily only as a temporary measure The change from these units has been a difficulty for everyone concerned, for the earlier units were stated in terms of biological reactions, and, as the reaction to any particular dose of a substance varies in different laboratories and at different times in the same laboratory, a "unit' of activity, so defined, would mean more, or less, at one time than at another, and possibly the difference would be greater still between 'units" in different laboratories The authors of this publication have fully realized this and quoted different workers findings for the relation between the international unit for each vitamin and the 'unit' as defined by some biological reaction, thus emphasizing the point that no really acceptable conversion factor can be used for restating old values in the new values of international units Therefore, values determined in the more recent units have been so stated and values determined by the old units have retained their old unit value in the tables at the end of the report As there is no International Standard of Reference for vitamin G (B in Europe), the only unit available was a biological one No unit of any sort for vitamin E was defined before the writing of this book, so no "E" values of foods have been given beyond the statement that cases of repeated abortion have been successfully treated with wheat-germ oil, and that this vitamin is widely distributed in natural foods The pellagra-preventing vitamin is treated independently of any particular B vitamin, which is wise, as no one seems to be sure which, if any, vitamin is the pellagra-preventing factor

Still another difficulty has been valiantly faced by these authors, the question of how much of each vitamin is required by man They have summarized the results of many workers and given figures from which anyone may judge for himself the minimum, the optimum, and possibly the excess amounts of vitamins for child and adult

Table I is a general summary of the vitamin content (A, B, C, D, and G) of some 330 different foods, many of them in numerous varieties—for example, about forty varieties of apples, sixty of liver oils, etc—and most of them under different conditions of storage, etc Different workers' findings for different samples of the same food have in many cases been given, which is useful, as it gives an indication of the variation in vitamin content which may be met and prevents young workers from thinking that all samples of, say, the same vegetable have the same vitamin content Table II is a summary of the ascorbic acid content of foods determined chemically and expressed as milligrammes per 100 grammes A vast amount of work has been done on this subject Table III is a digest of quantitative values for the vitamin A, B, C, D and G content of foods which will be found exceedingly useful for workers requiring single values for use in planning or analysing diets

The authors are to be congratulated on having produced such a reliable and useful book It will indeed be so much used for constant reference that it would be worth while to have future editions in strong binding rather than the stiff paper cover

DIATHERMY

Diathermy Including Diathermotherapy and Other Forms of Medical and Surgical Electrothermic Treatment By Elkin P Cumberbatch M A B M D M R E., F R C P., with nine collaborators Third edition (Pp 576 168 figures 21s net) London W Heinemann (Medical Books) Ltd 1937

Dr Elkin Cumberbatch's well-known *Diathermy* has now appeared in its third edition in a new and considerably enlarged form The scope of diathermy has increased enormously since its discovery by d'Arsonval, and in recent years has been further widened by the development of the kindred methods, short-wave therapy, and inductothermy Believing that it is now impossible for one person to be expert in all its branches Dr Cumberbatch has obtained the aid of nine collaborators, each of whom has written a chapter on the aspect in which he is especially skilled This adds considerably to the clinical interest of the book and obviates the criticism often made that the uses of diathermy in surgery and in the treatment of special sense organs have hitherto been described by the electrologist and not the specialist surgeon

The first section of the present volume is concerned with an account of the physical and electro-technical principles involved in the use of high frequency currents The chapter on physical principles is contributed by H J Taylor and is very clearly written, but many readers will be tempted to skip the mathematical part and pass on to Part II, where the first section, on diathermy and diathermotherapy, is of real interest To those who are not already aware of the value of diathermy in gynaecology and in chronic arthritis the two chapters by C A Robinson will be stimulating Another chapter written by Norman Bell Graham, deals with the treatment of general paralysis by diathermy and inductothermy, which are more easily controlled than the malarial method A very short chapter, by H B Stallard, describes the diathermy apparatus in use at Moorfields Hospital, and mentions, *inter alia* the very pleasing results obtained in the treatment of acute and subacute glaucoma pain being relieved at once and the tension lessened to allow of safe operation In a later chapter the same writer describes the treatment of detached retina by surgical diathermy

In Section II comes an account of short-wave currents and how they bring about biological effects One of the advantages in their use is that the patient does not have to be in actual contact with the electrodes, and this facilitates treatment of deep or inaccessible regions A great disadvantage is that the current in the patient's circuit

Scope for surgery. View to partnership.

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

written by recognized experts, and the list of contributors includes the best known chemists in the country The range of the subjects covered is indicated by the fact that the list of journals quoted includes about 700 titles

Perusal of the volume under review, which covers the range from A to Bi, shows that it deals with a large number of subjects of medical interest—for example, acridine dyes, adrenaline, alcohol, alkaloids, amino acids, organic antimonials and arsenicals, barbituric acid, bile acids, and pigments The prominence of such subjects indicates the increasing importance of biochemistry and chemotherapy A large proportion of the text is devoted to synthetic dyes, and in this relation it is of interest to note that the cover of the volume is dyed with monastral fast blue, BS This pigment was discovered in this country, and its discovery has been described as the greatest chemical achievement of 1936

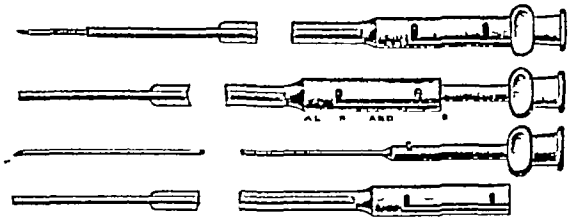
The editors intend to publish one volume yearly and to use each as a means of bringing previous volumes up to date The work will therefore form a continuous record of chemical progress It is an essential reference book for chemists and will be found of great value by workers in medical sciences who require information on chemical problems

Notes on Books

The Ebers Papyrus has been more than once translated into English but has not previously been considered critically by a member of the medical profession The translation by Dr B Ebbell (H Milford, Oxford Press, 15s) is therefore very welcome He is interested in Egyptology, and he was formerly a county medical officer in Denmark He dedicates his translation to Imhotep, the great Egyptian physician, rather than to Aesculapius, for he holds with much truth, that Greek medicine was derived in great part from an older Egyptian tradition *The Ebers Papyrus* written about 1550 B.C. dealt wholly with medicine, the *Edward Smith Papyrus* written about 1600 B.C. treated solely of surgery Both are free of the magical element which crept into Egyptian medicine at a later period, and both are based on still earlier writings, or, as we should now say, both are second editions It is interesting to notice how some remedies have held their own throughout the ages *The Ebers Papyrus* recommends the use of castor oil, colocynth, and senna as evacuants, teaches that pomegranate root is good against worms, and that tannin-containing plants should be given when astringent remedies are required

Dr L S T Burrell has now produced a third edition of his excellent book *Recent Advances in Pulmonary Tuberculosis* (J and A Churchill, 15s) Since the second edition appeared six years ago there has been considerable progress, and this called for the rewriting of a large part of the text Chapters have been added on infectivity and immunity, on bovine and childhood tuberculosis, and there is a new chapter on classification and types of pulmonary tuberculosis

Lungentuberkulose in Verbindung mit anderen Erkrankungen—ihre Häufigkeit und Behandlung by Dr Klaus Briest (Leipzig Georg Thieme, RM 4), will be found a useful little monograph Its purpose is to summarize recent work, including personal observations by the author, on the frequency with which other diseases are associated with tuberculosis the influence of each disease on the tuberculous process and vice versa, and the treatment as modified by the presence of the two conditions together Clinical descriptions, pathological facts, or theoretical considerations are not included The scope of the book in regard to the number of diseases discussed is however, very comprehensive, almost every abnormal condition apart from rarities being mentioned Hence the discussion under each heading is necessarily very brief, except for the more commonly described associated diseases such as diabetes, measles, etc Several hundred references, classified according to the systems of the body, are a valuable addition to the book



Die Porphyrine by Dr Curt Carrié (Leipzig G Thieme, RM 9) gives a good general review of the physiology and clinical importance of porphyrins Porphyrinuria is a relatively rare condition and hence the subject is one which has not been studied intensively The action of porphyrins in sensitizing the skin to ultra violet light is well known, and the author shows that they also affect the response of the skin to Grenz-strahlen, since these rays produce depilation more readily in an animal poisoned with porphyrin than in a normal animal

Preparations and Appliances

A MODIFIED FINSTERER'S NEEDLE

Mr Charles E Kindersley F.R.C.S. (Bath) writes

The splanchnic needle illustrated has been made for me by Messrs Allen and Hanburys, and embodies certain features which may be of advantage to those using splanchnic anaesthesia

The insertion of Finsterer's needle alongside the gloved hand often leads to perforation of the glove and possibly injury to a vessel The needle illustrated has a loose sharp needle running inside a blunt sheath and is controlled as to position inside the sheath by a double bayonet joint In one position the needle does not project from the end of the sheath and in the other is of the same dimensions as Finsterer's needle The sheath is flanged to enable it to be held firmly in the hand while operating the bayonet joint and pushing the sharp needle forward through the posterior peritoneum The blunt end of the sheath is applied firmly to the vertebra, and damage to the aorta, vena cava or other vessels is practically impossible I have found since using it that the introduction of splanchnic anaesthesia is more simple than with the unguarded needle

HAEMATINIC COMPOUND IN CAPSULES

Plastules brand of haematinic compound (John Wyeth and Brother Ltd 25 Oldhill Place N16) contain ferrous iron (5 grains $FeSO_4$) and yeast concentrate (3/4 grain) The plastules are flexible gelatin capsules and it is claimed that the inclusion in a sealed capsule prevents the oxidation of the ferrous iron whilst the capsules disintegrate rapidly in the stomach It is generally agreed that it is preferable to treat anaemias with moderate doses of ferrous salts instead of massive doses of ferric compounds provided that a stable preparation of the former can be obtained The yeast concentrate is added to provide vitamins B_1 and B_2 and cytochrome

Plastules brand haematinic compound with liver extract contain the constituents mentioned above with the addition of 2·62 grains liver extract This combination has been prepared for the use of those who believe that small doses of liver extract increase the therapeutic action of iron in hypochromic anaemias due to such causes as nutritional deficiencies and haemorrhage.

Rheumatism and Intestinal Medication . .

Constipation is often spoken of as a disease of civilisation, perhaps it might be more correctly described as a disease of domestication A functional failure of the neuro-muscular mechanism of the intestinal wall may result from the dryness and unstimulating character of the unabsorbed residues of modern dietaries, from persistent depressing emotional states, such as anxiety and worry, or from the repeated inhibition of reflex responses, in subservience to the conventions and conveniences of industry and of contemporary social life

So many people can so detach themselves from the social and industrial routine about them, as to remedy, by a return to a primitive way of life, the intestinal agony which is so frequent an accompaniment of chronic rheumatism and of physiological inefficiency generally In a recent text-book on modern treatment, a distinguished physician, whilst stressing the importance of remedying the constipation, utters a warning against taking, for any length of time, purgatives whose action is chemical and, therefore, irritative He points out, moreover, that the taking of a teaspoonful of ENO S Fruit Salt' in a tumbler of water first thing in the morning, is often helpful in warding off rheumatism and in re-educating the bowels

ENO S Fruit Salt is a carefully prepared combination of alkalis with fruit acids It has no added sugar or artificial flavouring ingredients Its action is dependent solely on its property of retaining within the alimentary canal some of the water that would otherwise be absorbed This both softens and adds to the bulk of the food residue and thus brings about elimination through the colon and rectum by natural means

ENO'S 'FRUIT SALT'

The words Eno and "Fruit Salt" are registered trade marks.

amount of vitamin C in tissue fluids can be estimated accurately, and tests have been devised to assess the needs of the body for vitamin C It is thus possible to show clear indications for its use, to judge the dosage, and, more important, to prevent its use in conditions where no benefit can accrue The problems of hereditary or idiopathic forms of the haemorrhagic state have not yet been susceptible of solution It was long thought that the spleen played a part with the bone marrow in their aetiology Splenectomy was successfully carried out in many cases though relapses may occur, suggesting that this should not be regarded as a specific cure for the disease

The discovery that trypsin causes the coagulation of citrated plasma has had practical application The mechanism is apparently that trypsin converts prothrombin into thrombin, just as the calcium-platelet compound does in the ordinary process of coagulation The second stage of clotting then follows, when thrombin converts fibrinogen into fibrin Trypsin is a proteolytic enzyme and in excess will digest the fibrinogen, rendering it incapable of coagulation by thrombin subsequently added It was discovered later that certain snake venoms known to contain proteolytic enzymes, and known to cause the coagulation of blood or plasma, also transform prothrombin to thrombin In some cases the venoms are effective in extraordinarily high dilution, 1 1,000,000 or more In clinical application loose clot is washed away from the bleeding point and tampons soaked in the venom solution are applied This appears to be a more workable method of treatment than the application of clotting healthy blood Without clear indications treatment of the haemorrhagic states must remain crude and ill directed Readers will welcome therefore the useful paper on the clinical pathology and methods of investigation of these cases, which Dr Dyke contributed to the Belfast discussion and which is reproduced in full at page 692

PORT HEALTH ADMINISTRATION

Efforts to prevent the spread of contagious disease from country to country by sea-borne commerce was first made at the time of the Black Death in the middle of the fourteenth century, when Venice, which then had a thriving trade with the East, instituted the system of quarantine for ships, passengers and goods from plague-infected ports This system of isolation for forty days was copied by other Mediterranean ports and gradually by most of the maritime countries in both hemispheres That it failed in its purpose is evidenced by the fact that bubonic plague was spread by shipping throughout the world, but it continued to be the accepted practice for more than 500 years because, in the absence of knowledge of the aetiology of plague, no other method of control could be suggested, indeed, from the beginning of the nineteenth century the system was extended to cholera and yellow fever It is obvious that as international trade developed and the speed of ships increased quarantine became a more and more intolerable burden, and this country with its great shipping interests, was the first to discontinue it, but not until the discovery of the cause and mode of spread of cholera and plague was it possible to obtain international agreement on a system of control at the same time more efficient and less restrictive than quarantine Now procedure is regulated by the International Sanitary Convention of 1926, which has been ratified by practically all the maritime countries, and which is based on the medical inspection of ships on arrival, subsequent action being governed not by the health conditions in the ports of departure and call but by the medical history of the voyage and the health conditions existing on board the ships themselves

In the British Isles these duties have since 1872 been discharged by Port Sanitary Authorities, which from October 1 of this year will be known as Port Health Authorities The change of title has been made because of the limited significance popularly attached to the word sanitary and of the increased scope of the work of the Authorities, which began with the prevention of the importation of cholera, plague, and yellow fever, and has been extended to include the control of all imported infectious sickness, rat repression in ships and on shore as a plague-preventive measure, supervision of the hygiene of living accommodation in ships, inspection of imported foods, control of the importation of parrots as a safeguard against psittacosis, smoke abatement, inspection of canal boats and of water boats, control of shellfish layings, and the general sanitary supervision of the port area The amount and importance of the work of a Port Health Authority may be appreciated from a glance at the annual report of the Medical Officer of Health for the Port of London for the year 1936 The Port of London extends throughout the tidal portion of the River Thames from Teddington Lock to east of the Nore Lightship nearly seventy miles There are in addition over forty-five miles of dock quays The tonnage of ships entering the port during 1936 was over thirty millions, 2,397 vessels were boarded by the medical officers and 15,531 by the sanitary inspectors, 215 vessels were reported as having or having had infectious disease on board during the voyage Many of these cases were landed abroad or convalescent on arrival, and

of ventilation, the air was still contaminated and wound infections still occurred He therefore persuaded a firm of electrical engineers to construct a multiple lamp emitting bactericidal light rays The constructional details of this lamp are not divulged, a fact for which the manufacturers can hardly be blamed since it is said to kill staphylococci at five feet range within one minute and at even greater distances in longer periods although the rays are harmless to skin and to wounds By using this lamp the air of the theatre was kept almost completely sterile within a radius of eight feet from the operation site and wound infections were entirely prevented This device evidently has a considerable future At the same time one may wonder whether the mechanism by which air becomes contaminated with cocci is fully understood and whether some precaution other than what will doubtless be a very expensive piece of apparatus might not serve to prevent this Do these cocci which are said to re-invade the air soon after the lamp is switched off really come from the upper air passages and, if so how?—assuming that an impermeable type of mask is being used No one has ever suggested that mere breathing can expel bacteria, if silence were enforced and mouths kept shut would the air remain free? The author's investigations have been exhaustive and nothing stands in the way of accepting his conclusions except the difficulty of believing that "droplet" infection can wholly account for the rapid pervasion of air by bacteria when every known precaution is taken to prevent it That nose and throat carriers of haemolytic streptococci, and no doubt of staphylococci can be a serious danger there is no denying, but the impunity with which they are sometimes employed or disregarded suggests that there is something still to be found out about how their bacteria reach the patient.

INDUSTRIAL HEALTH RESEARCH

The seventeenth annual report of the Industrial Health Research Board[1] indicates that the work of the Board is not only continuing on the lines described in earlier reports but that it is branching out widely in a number of fresh directions Among the most interesting and important of these is the large-scale investigation—statistical, clinical and environmental—which has been initiated by the Medical Research Council into silicosis Certain coal mines have been chosen in which there are notable differences in the incidence of silicosis, both certifiable and non-certifiable and in these each underground worker will be examined clinically and radiologically while at the same time investigations will be made on the dust in the pits, the temperatures the humidities and other conditions Another investigation, and one of general public interest relates to transport accidents The accident records of groups of motor drivers during the last six years have been collected and analysed and the men have been given psychological tests in relation to accident-proneness Also a special apparatus has been constructed for testing the effects of alcohol consumption on the speed of drivers The investigation is being extended to flying accidents in order to determine the practical value of the tests for the prognosis of accident proneness among air pilots of the Royal Air Force Several investigations on occupational fitness are in progress the most novel of them relating to art and industry It is found that many pupils take industrial art courses lasting four or five years, at the end of which they are not even good technicians and the problem to be solved is to find tests which pick out the unsuitable pupils at an early stage of training Of the other psychological problems under investigation one relates to the reduction of boredom in industrial workers and two others to the extent of the nervous temperament in industry The physiological researches include a determination of the light desirable in the weaving of worsted cloth It was found to be as high as 30 foot-candles on the cloth itself, and still higher at certain parts of the loom An ophthalmological report on operatives engaged in close work on comptometers showed that about half of them required correcting glasses for their work The investigations on heating and ventilation include one on warmth and comfort another on stimulating air environment, and a third on the measurement of the rate of air change in rooms Researches on noise and other subjects might be mentioned if space permitted Both individually and collectively they bear striking testimony to the continued vigour of the Board's investigators

TRAUMA OF THE BRAIN

The ever-increasing number of street accidents continues to provide the medical profession with abundant material for clinical and pathological study A recent contribution by C P Symonds[1] deals with the important question of mental disorder following head injuries which was also discussed at the Section of Neurology and Psychological Medicine at Belfast A careful investigation into the histological basis of concussion has been undertaken by Schaller Tamaki and Newman,[2] who examined a series of brains from cases in which death had ensued at varying periods after cerebral trauma They found that in all cases deep petechial haemorrhages were present which could not be explained by a traumatic tearing of the vessels These petechiae were not seen in the cerebral cortex except in one instance the only one in which rupture of the vessels could be demonstrated in relation to the haemorrhages In general, the petechiae were found in the corpora striata, the midbrain and the pons, and in some cases in the cerebellum They were more often seen round the arterioles than round the capillaries, and it was therefore suggested that the primary effect of the trauma was on the vasomotor innervation The appearance of the blood vessels in cases with different survival periods suggested the following sequence of events dilatation of the vessels and diapedesis of blood cells (causing perivascular petechiae), followed by degeneration of the walls of the vessels stasis and subsequent throm-

[2] *Arch Neurol Psychiat* Chicago, 1937 37, 1048

Prolonged bleeding from such a small puncture never occurs in haemophilia, and may at once be held to exclude that diagnosis

Blood Picture

In those cases in which lymphatic leukaemia is the cause of the development of the haemorrhagic state the preliminary examination of the blood picture will serve to establish the diagnosis The discovery of the typical blood picture in a patient suffering from haemorrhagic purpura often comes as a surprise, it is too often forgotten that lymphatic leukaemia may exist in the complete absence of enlargement of the lymph nodes or spleen A low white cell count does not in itself serve to rule out this diagnosis the morbid state which is the basis of lymphatic leukaemia may exist without the escape of the abnormal white cells into the blood stream Such cases will present the clinical picture of anaemia with haemorrhagic manifestations but with a marked diminution of the white cells Such white cells as are present in the blood stream will be mainly of the lymphocytic order Frequently there may be pyrexia and gangrene of the mucous membrane of mouth or gums in such cases the differential diagnosis from agranulocytic angina may be almost impossible short of examination of samples of bone marrow obtained by sternal puncture and it is to my mind very doubtful whether this procedure should play any part in the clinical diagnosis of the haemorrhagic states

Blood Platelets

In the absence of any abnormalities, either morphological or numerical, of the white cells attention must be directed to the appearance of the platelets in the stained film If such films show few or no platelets and especially if such examples as appear are larger than normal the possibility of thrombopenic purpura (purpura haemorrhagica) presents itself If films show abundant platelets this possibility may be set aside

Assuming that the films show apparent diminution or absence of platelets, their enumeration is called for For this purpose many techniques have been devised My own practice is to prick the finger through a drop of 2 5 per cent sodium citrate solution in normal saline The mixed drop of blood and diluent is rolled into a wax-lined Widal tube half filled with the same solution By means of a wax lined pipette a drop of the diluted blood is transferred to a slide, covered with a slip, and ringed with vaseline Using an oil immersion objective the platelets are counted against the red cells From the number of red cells per c mm the number of platelets may readily be calculated In my experience a platelet count of over 50 000 per c mm serves to exclude purpura haemorrhagica as a cause of bleeding

A blood picture showing in the face of purpura and other manifestations of an established haemorrhagic state no morphological abnormalities of the white cells and the presence of platelets in relatively normal numbers will suggest the possibility of an anaphylactoid condition of the Schoenlein or Henoch type A history of preceding urticaria or the presence of arthritic manifestations will be deciding factors The platelets may be deficient but on enumeration will never be found to be below 60 000 per c mm in purpura of anaphylactoid type

Scurvy

A blood picture normal except for anaemia with a clinical history on the basis of which both purpura haemorrhagica and idiopathic purpura can be eliminated, especially if occurring in a young child should arouse suspicion of scurvy Fully developed scurvy is now a rarity but it still does occur, and not always among the more needy strata of the population I have seen one case in the baby of a well to-do family of which both the mother and father were university undergraduates The child had been entrusted to the care of an old family retainer who had many years ago acquired and still steadfastly maintained faith in one of the earlier brands of proprietary infant foods The condition is not unusual in adults as a result of prolonged adherence to a diet of milky slops for the treatment of gastric discomfort, often diagnosed as peptic ulcer but usually nervous dyspepsia

The work of Harris and Ray (1935) and of Abbasy, Harris Ray, and Marrack (1935) appears to offer a means of diagnosing subscorbutic states According to these authors the body should naturally maintain a reservoir of vitamin C If this reservoir is properly filled a large proportion of a massive test dose of the vitamin will be excreted in the urine failure to excrete the major part of a suitable test dose within twenty-four hours indicates a state of vitamin C deficiency otherwise latent scurvy The test presents no particular difficulty The ascorbic acid may be given either orally or parenterally in the form of redoxon (Hoffmann-La Roche) The titration of the excreted acid in the urine by means of the dichlorphenol indophenol reagent is readily carried out Using reagents kindly supplied by Messrs Hoffmann-La Roche Dr Freida Young has in my department at the Royal Hospital investigated a number of patients suffering both from haemorrhagic and from other conditions Reduced excretion was found in many cases haemorrhagic and otherwise in fact, few patients—no matter what their condition—satisfied Harris and Ray's standards for the normal We were forced to the conclusion either that a large part of the hospital class population of this country is suffering from latent scurvy or that the standards for normal excretion are still to be established

Coagulation Time

The estimation of the coagulation time of the blood is next to the general examination of the blood picture the most important procedure in the clinical pathology of the haemorrhagic state In spite of its importance the technique remains very imperfectly standardized a number of methods are available In order to obtain comparable results it is essential that the observer should adopt one method and follow it closely The capillary tube system of Dale and Laidlaw (1911–12) is handy, and has the advantage that the observations are made in a water bath at a temperature of 37 C By this procedure however the clotting time is very short Dale and Laidlaw regarded one minute forty five seconds as being the mean of the normal with only slight variation on either side This method has the disadvantage that even in morbid states in which the clotting time is increased the actual extension shown by it is not great thus in a case of haemophilia in which the test-tube clotting time was half an hour by the capillary tube it was only four minutes The older method of Lee and White (1913) though not so convenient gives more readily comparable results Blood is taken from a vein by means of a syringe previously rinsed in saline and is transferred in amounts of about 1 c cm into test tubes of 8 mm bore also previously rinsed with saline Timing them with a stop-watch, the test tubes are alternately rotated about their short axes at half minute intervals That point is taken as the end point at which

DAYLIGHT AND WORK

Whether a room is suitable for work of a particular kind depends among other things on how much daylight it receives, unless indeed we are to follow the lead of some artificial lighting enthusiasts who would abolish windows and give us uniform air-conditioning and lighting Since we still like daylight it is important to know how much of it is required for different kinds of work One way of determining this is to measure the illumination at the instant at which a worker switches on the artificial light because he finds that the daylight is not enough More important still is the effect of what is customarily enjoyed on what is demanded as a minimum—in other words, does a worker by the window demand a higher minimum illumination than a colleague who works at the back of the room? In a report issued by the Department of Scientific and Industrial Research entitled "Daylight Illumination Necessary for Clerical Work"[1] Mr L H McDermott describes a series of ingenious experiments designed to obtain answers to the questions The experiments were conducted in a room in a Government office where there were seventeen typists, each of whom had a separate desk lamp Immediately a typist switched on her lamp the current through it automatically actuated a cinematograph camera which took photographs of the scales of instruments recording the daylight at that moment From these data it was possible to infer the daylight illumination at each desk when the light was switched on From a large number of such records assuming the subjects of this investigation to be average individuals and working under average conditions, it appears that the value of the illumination at which in general they found they needed additional light was approximately 5 foot-candles These results can be applied to determine the average "lighting-up time" at any season of the year for any specified point in a room given the daylight factor for that point and data concerning the variation of outdoor illumination throughout the day at all times of the year The latter have been accumulated at the National Physical Laboratory at Teddington from recordings over several years with a photo-electric apparatus The results express in the form of curves the mean daily variation of daylight illumination for each month of the year and the period for which daylight will on the average suffice for positions of different daylight factors

TRACHOMA AS A RICKETTSIA

The failure to confirm the claims of different observers for some organism or other, including that for Noguchi's *Bacillus granulosis* as the causative agent of trachoma, has focused attention of late years on the virus rather than on the microbe and a good deal of evidence has accumulated in this direction Important work by von Szilly[1] in 1935 on the results of inoculating the vitreous with trachoma material showed in a striking way that follicle formation was indeed a characteristic feature of the causative agent of trachoma Busacca[2] in Brazil and Cuenod and Nataf in Algeria have been concentrating on the possibility of trachoma having a similar origin to typhus, since the epidemiological conditions of the two affections are similar Much attention having been given to the Rickettsia in the aetiology of typhus, these observers applied the same approach to trachoma In two recent summaries of their work Cuénod and Nataf[3] point out that the granular dots found in trachoma debris, sometimes in a free state and at others as the Halberstaedter-Prowazek inclusion bodies, must be regarded as the result of actual lysis of epithelioid cells and not as bits of cells produced by the mechanical act of crushing the trachoma follicle They consider that these dots contain the actual infecting agent, though they are too small to allow of differentiation by the microscope, they have certain morphological characteristics that can be studied, and, what is more important, they have the biological behaviour of a causative agent of infection For one thing when laboratory-bred lice, which are free from intestinal parasites are infected with trachomatous material, real cultures *in vivo* of Rickettsia can be obtained in their intestines furthermore experimental infection of the monkey by such cultures produces trachoma Their experimental procedure was as follows trachoma material was collected from a patient and injected into the testicle of a guinea pig a culture of Rickettsia being obtained in this manner lice were infected with this culture, and after the infecting material was passed through a series of lice it was finally inoculated into the conjunctiva of an ape which developed clinical trachoma This ape in turn was used to infect another A further experiment consisted in infecting the conjunctiva of a blind human eye with Rickettsia cultured in lice, this was followed by clinical trachoma, confirmed by the usual laboratory and biomicroscopical tests Other observers have been working on similar lines Additional evidence of an experimental type is supplied by Poleff, in Morocco In his most recent communication[4] he describes the findings of Rickettsia as shown by passage through carriers in an undiminished infecting capacity, in the pannus of trachoma The accumulated evidence is imposing Should these findings be confirmed a controversy that has raged for over thirty years on the significance of inclusion bodies in trachoma will find a ready solution

Mr Leslie Paton of London will receive the Mackenzie Medal and deliver the Mackenzie Memorial Lecture at Glasgow on Friday October 29, in the Hall of the Royal Faculty of Physicians and Surgeons, 242 St Vincent Street at 8 30 p m The subject is "Optic Neuritis"

We regret to announce the death of Dr William St Clair Symmers emeritus professor of pathology in Queen's University Belfast

PRONTOSIL AND SIMILAR COMPOUNDS IN THE TREATMENT OF PUERPERAL HAEMOLYTIC STREPTOCOCCUS INFECTIONS*

BY

G F GIBBERD, M S, F R C S, M C O G

Assistant Obstetric Surgeon Guy's Hospital Obstetric Surgeon to In patients Queen Charlotte's Maternity Hospital Surgeon to Out patients Samaritan Hospital for Women

Since 1936 prontosil and similar compounds have been used extensively in the treatment of puerperal infections due to the haemolytic streptococcus Fuller (1937) has studied the chemical changes which prontosil undergoes in the body, and he has suggested that the active part of its molecule is sulphanilamide, so that the latter (simpler) compound probably acts in the same way as the more complex At the isolation block of Queen Charlotte's Hospital prontosil was used in the first part of 1936, and streptocide (a preparation of sulphanilamide) has been employed since As it is my purpose to study the clinical value of this group of drugs as a whole, I have drawn no distinction between the earlier cases treated with prontosil and the later cases treated with streptocide I have referred to these drugs collectively as the 'new aniline derivatives,' and to their use as the new chemotherapy Prontosil has been given by intramuscular injection and by mouth in daily doses of 20 to 60 c cm (0 5 to 1 5 grammes) intramuscularly, and 6 to 12 tablets (2 to 4 grammes) by mouth Streptocide has been administered by mouth in daily doses of 8 to 20 tablets (2 to 5 grammes) The maximum doses have been given to patients who appeared to be severely ill, and these doses have been continued until clinical improvement has occurred After this the dose has been decreased, but smaller amounts have usually been used for as long as a week after the temperature has fallen to normal

The New Chemotherapy

Some patients have developed marked cyanosis due to met- or sulph haemoglobinaemia but in no case has this complication given rise to anxiety, and it has always disappeared on withdrawal of the drug. In a few cases of severe infection the use of the drug has been continued in spite of the cyanosis without any untoward effect There does not seem to be any constant relation between the dose administered and the tendency to develop cyanosis Apart from cyanosis no serious ill effects have followed the giving of these drugs

These aniline derivatives have been used at the isolation block of Queen Charlotte's Hospital since January 1936, and I have to thank my colleagues on the clinical and laboratory staff for allowing me to report upon all the patients with haemolytic streptococcal infections of the birth canal who were admitted from January 1936 until March 1937 It is now a routine practice to employ one or other of these drugs in every case of haemolytic streptococcal infection but in the early part of 1936 there were some twenty patients to whom they were not given because of the mildness of the infection These cases are included together with those treated by drugs during 1936–7 because I wish to show broadly what changes there have been in the results at Queen Charlotte's isolation block since the introduction of the new drugs rather than to give details of cases treated As I have said, it is not my intention to make any comparison between the earlier cases treated with prontosil and prontosil soluble and the later cases treated with sulphanilamide The first group has already been reported upon by Colebrook, Kenny, and the staff of *Queen Charlotte's Hospital (1936)* The second group will be the subject of a report to the Therapeutic Trials Committee of the Medical Research Council, and this report will subsequently be published I have also given the results of cases of haemolytic streptococcal infection admitted to the isolation block in the two years immediately preceding the introduction of the new drugs *(1934–5)*

There are thus two groups of patients to compare The outstanding difference in the treatments in these two groups is that the new aniline derivatives were used almost as a routine in the one group and not at all in the other

TABLE I—*Results of Puerperal Infections due to the Haemolytic Streptococcus*

	1934–5 Group			1936–7 Group		
	Number of Cases	Deaths	Mortality per cent	Number of Cases	Deaths	Mortality per cent.
(a) Total number of puerperal infections due to the haemolytic streptococcus	210	42	20	157	7	4.5
(b) Total number of infections clinically limited to the birth canal	98	0	Nil	104	0	Nil
(c) Total number of infections showing definite clinical evidence of localized spread beyond the limits of the birth canal (excluding septicaemia and generalized peritonitis)	50	0	Nil	30	1	3 3
(d) Total number of infections in which the haemolytic streptococcus was demonstrated on blood culture (excluding cases in which generalized peritonitis was also proved)	28	11	40	21	9	20
(e) Total number of infections in which generalized peritonitis was proved to be present (excluding cases with septicaemia)	18	15	83	1	0	Nil
(f) Total number of infections in which both septicaemia and generalized peritonitis were proved to be present	16	16	100	1	1	100

Table I *(a)* shows that the gross mortality in the 1934–5 group was 20 per cent compared with a mortality of 4 5 per cent in the 1936–7 group The reduction in the mortality rate during the period when the new drugs were used is very striking In their original reports Colebrook and Kenny considered the significance of these improved results and were cautious in attributing them entirely to the treatment with the new drug They drew attention to the fact that there had been a progressive fall in the mortality rate from haemolytic streptococcal infections admitted to the North Western Fever Hospital London in spite of the fact that the new treatment was not used in that hospital, and they quoted Mr James Wyatt's figures in this connexion They pointed out, however that the fall in mortality rate at the North-Western Fever Hospital had been progressive over a number of years whereas there had been no such progressive fall at Queen Charlotte's The fall from about 20 per cent to 4 7 per cent which they quoted from Queen Charlotte's was abrupt and coincided with the introduction of prontosil into the scheme of treatment

* Read in opening a discussion in the Section of Obstetrics and Gynaecology at the Annual Meeting of the British Medical Association Belfast 1937

b scuits It may be mentioned that should the operation be timed for later in the day light meals can be taken until as late as possible—say, until three hours before Hunger is bad and starvation may lower the liver glycogen

Small children will as a rule sleep well with a certain amount of coaxing, but if their surroundings disturb them, and especially if they know they are to have an operation, sleep may be impossible without help Chloral is a useful sedative in doses of 1 grain for each year of life, with syrup aurantii 30 minims and water to 1 drachm

Premedication

Several factors need to be considered in deciding what drugs to use for premedication—the temperament of the patient, his general condition, and the anaesthetic it is proposed to employ The indications for some form of pre operative sedation fall into two categories The first is the removal of the unpleasant sensation of being taken conscious to the theatre and there being anaesthetized with something evil-smelling over the face Even the placid who seem to approach operations with equanimity may suffer much mental distress, while with nervous patients the removal of this dread may be an important factor in the success of the operation A pre-operative sedative will also reduce the amount of inhalational anaesthetic required, and if suitably selected will make it possible to conduct an operation under nitrous oxide and oxygen when this would otherwise be impossible It will reduce considerably the amount of ether required in deep anaesthesia for upper abdominal operations It is necessary, however, to exercise judgement in the selection of cases and in the amount of sedation employed The action of the drugs used is long and cannot well be reversed once they have been administered The disadvantages can be summarized as follows

1 The possibility of the airway becoming obstructed as the jaw relaxes, a condition made less obvious by the quiet respiration necessitates skilled watching after administration

2 The depth of narcosis, at first satisfactory, may, if shock develops, become dangerously deep

3 In such cases insufficient aeration may be present afterwards from respiratory depression, although this may have been controlled during the operation This, too, makes skilled nursing necessary

4 Such a period of reduced pulmonary ventilation will tend to increase the risk of respiratory complications, while a prolonged absence of the cough reflex may have the same risk

5 The possibility of derangement of liver function by barbiturates, and possibly by avertin, in cases of hepatic insufficiency

Unless he has some experience in pre operative medication the anaesthetist would do well to keep within the recognized scale of doses—or below, when age, weight, or feebleness suggest caution In any event sedation should not be pushed to the stage of full anaesthesia (evipan and pentothal are not now being considered) but this should be completed by some inhalational method more under minute-to-minute control Some obstetricians consider it unwise to give anything but atropine before Caesarean section because of the depressing action on the foetal respiratory centre

Atropine

The most commonly used drug is atropine It decreases the secretion of mucus and paralyses the vagus thus diminishing one of the dangers of chloroform It has no sedative action For patients over the age of 2 years the dose is grain 1/100 Below this age it should be prescribed as follows up to 6 months grain 1/300, 6 to 12 months grain 1/200, 1 to 2 years grain 1/150 Atropine should be given in all cases except in operations of only a few minutes duration and in those in which hyoscine is being used (hyoscine has a similar action to atropine in reducing secretion) Hyoscine is better substituted for atropine in cases of hyperthyroidism in view of the metabolic stimulation of atropine

Morphine and Hyoscine

Pre operative sedatives fall into two categories those producing drowsiness and amnesia, and those producing unconsciousness The first category is represented by morphine and hyoscine, which together form an extremely good combination The standard dose for adults is morphine grain 1/6 to 1/4 hyoscine grain 1/150 In some cases the patients will be asleep when the anaesthetic is started, but short of this there will be drowsiness and absence of anxiety and afterwards a partial or complete amnesia Omnopon gives rather better results than morphine the usual dose—grain 1/3—is the equivalent of rather more than 1/6 grain of morphine

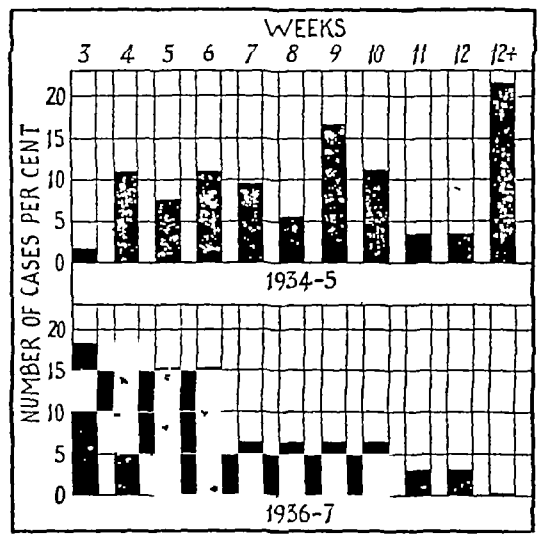
There are few contraindications but some drawbacks In view of the respiratory depression—not great, however, and usually more noticeable during the anaesthetic than before—pure chloroform should not be used and avertin is better avoided For the same reason open ether is sometimes more difficult to give The shallow breathing and tendency to apnoea make it difficult for a sufficient quantity of anaesthetic to be introduced The signs of anaesthesia are less obvious and the anaesthetist may be misled by a condition similar to chloroform sleep But with experience this can be overcome Carbon dioxide is a valuable help These objections apply to all pre operative sedation and make the use of some form of closed anaesthesia with its greater control of respiration desirable

Morphine and hyoscine are safe, and will be found the most suitable agents for routine use before general and spinal anaesthesia The doses recommended here are as a rule sufficient but may be exceeded in suitable cases The injection should be given one hour before the operation and preferably with the patient on the stretcher or trolley The room should be darkened and kept quiet, as with all forms of sedation The action of morphine and hyoscine may be supplemented by an intravenous injection of one of the short-acting barbiturates—evipan or pentothal—which should be given immediately before induction of the inhalational anaesthetic and should be pushed to the stage of profound sleepiness just short of surgical anaesthesia When either of these two drugs is to be used as the main anaesthetic a similar injection of morphine and hyoscine will be found to improve the anaesthesia and reduce the dosage

Basal Hypnosis

Paraldehyde is the safest basal hypnotic In normal doses it does not depress respiration and the cough reflex is not abolished Since it is excreted in the breath it has no effect on liver or kidneys Its smell is noticed least by the patient It is administered in ten times its bulk of saline as a rectal injection with the patient on the left side The standard dose is 1 drachm per stone of body weight and should be given one hour before operation Young children, the elderly and the sick should receive about 20 per cent less Results are good but conscious

of the organisms to generalize the infection and the issue is often in the balance for some days Unless laparotomy is performed, post mortem examination is the only way in which a certain diagnosis of 'generalized or 'generalizing (as opposed to localized or localizing) peritonitis can be made The frequency and the readiness with which laparotomy has been employed at Queen Charlotte s Hospital has varied from time to time, so that the opportunities for proving a diagnosis of generalizing or 'generalized peritonitis have also varied It is not necessarily of significance, therefore, that there were thirty four such cases in 1934–5, against two cases in 1936–7 Changes in proved post mortem findings are, however, significant In the 1934–5 group (210 patients) generalized peritonitis was found post mortem in twenty nine cases In the 1936–7 group (157 patients) it was found post mortem in only one case The relative rarity of this proved necropsy finding in the latter group must mean either that the invasiveness (virulence) of the prevalent streptococcus was very much less in the 1936–7 group or else that the new chemotherapy was very effective in preventing the widespread dissemination of the infection



Results from the New Chemotherapy

It is clear from the above analysis that since the introduction of the new chemotherapy there has been a very great improvement in the results obtained at the isolation block of Queen Charlotte s Hospital The improved results are demonstrated (1) by a considerable fall in the total mortality rate, (2) by a reduction in the proportion of cases in which the infection spread beyond the limits of the birth canal and by the relative infrequency with which an inflammatory mass developed after treatment had been instituted, (3) by a significant fall in the mortality rate in cases of proved septicaemia associated with a relative decrease in the proportion of severe cases of septicaemia, and by a fall in the incidence of septicaemia developing after the treatment had been instituted, and (4) by the relative infrequency with which generalized peritonitis has been found post mortem There is no doubt about these facts There is some doubt about their meaning

Although they can be explained by assuming that the new aniline derivatives have supplied a highly effective remedy for haemolytic streptococcal infections most of them can also be explained by assuming that the virulence of the haemolytic streptococcus has diminished spontaneously in the period during which the new drugs have been employed There are few features revealed by the results so far discussed that cannot be accounted for on either hypothesis These good results are mainly an expression of diminished invasion of tissues (including the blood stream) by the organisms This may be the result of increased resistance on the part of the tissues—that is it may be due to the chemotherapy—or it may be due to diminished virulence of the organism itself It is a matter of personal fancy which of these alternative explanations will appeal to any of us as individuals but the accumulated experience of the past shows that a fortuitous change in the virulence of a prevalent organism is no more improbable than the discovery of an effective chemotherapeutic substance

Is there any method apart from the test of time—and in this case the time must necessarily be many years—by which we can get evidence in this urgent question' Can it be shown that in non fatal cases where invasion of tissues has actually occurred the new chemotherapy is effective in hastening the resolution of the disease? The accompanying diagrams show the time taken for patients to recover sufficiently to be discharged from hospital in cases having a localized spread of infection outside the birth canal (as proved by the demonstration of an inflammatory mass in the pelvis or abdomen) Some such patients died from an associated septicaemia or general peritonitis All deaths have been excluded, and the cases have been grouped according to the number of weeks that elapsed between the confinement and the time the patient returned home The number of patients in each group has been expressed as a percentage of the whole

When the cases are arranged in this way it appears that there was a considerable shortening in the time of the average illness in the 1936–7 period as compared with the 1934–5 period If we take these diagrams at their face value the improvement during the period of chemotherapy cannot be accepted as evidence of diminution in the virulence of the prevalent haemolytic streptococcus during this period, because we are dealing only with cases with demonstrable invasion of tissues outside the birth canal and invasion of tissues is in fact the clinical manifestation of virulence To suggest that although the streptococcus of 1936–7 invaded the tissues in these selected cases it was less virulent than the streptococcus of 1934–5 which did precisely the same thing is to ignore what we know of the morbid anatomy of haemolytic streptococcal infections We know for example, that the virulence of the diphtheria bacillus depends upon its ability to produce a very potent toxin and not at all upon its power of invading tissues Clinical and pathological experience has taught us that the haemolytic streptococcus behaves in an entirely different way It kills the patient only in so far as it invades her tissues widely, and the conception of a relatively avirulent haemolytic streptococcus that invades tissues widely is a contradiction in terms that finds no support in practical experience

Diagrams showing the duration of the illness (interval between confinement and discharge from hospital) in non fatal cases in which an inflammatory mass was demonstrated beyond the limits of the birth canal The percentage distribution of patients is indicated by the height of the columns The results for 1934–5 are compared with those for 1936–7

Taken at their face value therefore the diagrams indicate that the shortened convalescence in the patients treated with the new aniline derivatives is to be attributed to the treatment rather than to another variable factor This is the most significant piece of direct evidence that I have

OPENING OF THE NEW SESSION

LONDON SCHOOL OF MEDICINE FOR WOMEN

MR EASON'S INAUGURAL ADDRESS

The inaugural address to students of the London (Royal Free Hospital) School of Medicine for Women was given on October 1 by Mr H L Eason M S, F R C S, Principal and late Vice Chancellor of the University of London with Miss Elizabeth Bolton the dean, in the chair Mr Eason urged his hearers to keep ever before their minds an ideal of conduct and a lively care for the integrity of their professional life Medicine, though an honourable and trusted profession held out many temptations and few privileges

Citadels and Temptations

In medicine as in all other professions, there is a small minority with no principles who by their actions bring discredit on their profession out of all proportion to their number and lead the public to think that they represent the common code of honour among us In a recent novel such a group of happily fictitious practitioners in the West End have been pilloried and what has been written about them in a portion of that novel has overshadowed in the public notice the finer side of the profession which is displayed in the greater part of the book I personally think the medical profession and the public owe a debt of gratitude to the author of that novel for having disclosed to the public how the science and art of medicine may be and is on occasion prostituted for gain

I have always felt that if the question of payment could be left out of our practice we should all be in a happier and more independent position Throughout my professional career I have been more at ease in my hospital out-patient department, where money payments do not come into the picture than I have been in private practice It is quite true that the labourer is worthy of his hire and surely the man or woman who by skill and care saves life or relieves suffering is entitled to the reward of his skill But to those doctors whose moral fibre is not of the strongest the temptation to make money sometimes warps their conscience To get rich quickly and to make easy money out of the fear and apprehension of your patients is the most insidious temptation that you will have to meet To keep the narrow path between undercharging and undercutting on the one hand and on the other hand bleeding by excessive fees those who are in terror of pain is no easy matter

Specialism, General Practice, and Quackery

Another problem in medicine was specialization, which had its advantages from the point of view of expert technique and special experience, but had its dangers in the shape of narrowed outlook Unless the specialist kept his mind well open to the broader aspects of medicine and surgery he would inevitably tend to look at all disease from the point of view of his own specialty The good general practitioner had the widest outlook and the least prejudice Seeing his patients year in, year out their father confessor in many matters other than those purely professional he realized that he was dealing with human beings and not merely with cases He saw disease in its earliest stages and he also saw the progress of his patients through the hands of specialists and consultants and could better than anyone keep an unbiased outlook on the false claims and true between successful and unsuccessful treatment and between professional honesty and dishonesty The patient who had an honest general practitioner and who trusted him was the most fortunate of all and was the best served

In a reference to quacks Mr Eason said that the public had always a great belief in the unqualified practitioner and in medicine, as in sport, preferred the amateur to the professional He was free to advertise, and his failures seldom came to light He got his living from two classes of society The idle and ignorant rich frequented the osteopath, the chiropractor, and other miracle mongers and the ignorant poor patronized the herbalist In between them the solid business and professional classes trusted their doctor as they trusted their lawyer, their stockbroker, and their other professional advisers

It is true that from time to time unqualified persons evolve methods of treatment that are subsequently taken up by the medical profession but these unofficial discoveries are not peculiar to the profession of medicine The amateur has often made discoveries in other branches of science and knowledge discoveries not foreseen by the trained scientist but this is not necessarily derogatory to the profession I would advise you however that throughout your career you should keep your eyes and ears and especially your mind open to any new trend of thought or method of treatment however unorthodox its source Try it out fairly and if after due inquiry you find it sound make use of it

---

MIDDLESEX HOSPITAL ANNUAL REUNION

A company of more than three hundred past and present members of the Middlesex Hospital Medical School met at the Savoy Hotel on Friday, October 1, the occasion of the annual reunion dinner Dr Douglas McAlpini, neurologist to the hospital, presided over a very happy gathering Mr E W Meyerstein, a generous supporter of the hospital and the medical school, whose gifts have totalled many thousands of pounds, was unable, owing to doctor s orders, to attend He however sent a cheerful telegram, and two of his most recent gifts were gratefully acknowledged during the evening

In proposing 'The Middlesex Hospital and Medical School, the Chairman mentioned the loss sustained by the hospital during the past year through the death of Sir John Bland-Sutton, to whom he paid a special tribute Future generations of Middlesex men would think of Bland-Sutton not only as the donor of the Institute of Pathology but as the man who had set a standard of achievement which would be an inspiration for all time Time was responsible for the retirement during the past year of Dr R A Young for thirty five years a member of the staff and one who had risen to high office in the College of Physicians, also Mr W Sampson Handley, who had acquired an international reputation in respect to the treatment of cancer and had helped to place the hospital in the forefront of the campaign against that disease Discussing the hospital s progress the Chairman said that the new radiotherapeutic department, although not officially opened, was already receiving patients It was he thought the finest department of its kind in the country It had been made possible by yet another magnificent gift from Mr Meyerstein The treatment of cancer in that department would bring relief to hundreds of sufferers and even cure some The new hospital was now complete, although over 100 beds remained unopened, and there was urgent need for fresh additions to the school buildings

The toast was responded to by Mr Richard C Davis (Chairman of the Medical School Finance Committee) Dr H E A Boldero (Dean of the Medical School), and Mr E M Japha (senior Broderip Scholar) Mr Davis was able to report that the income of the school was satisfactory and took the opportunity to express gratitude to the Medical Research Council and the British Empire

is by far the most potent and it tends to invade the deeper parts of the follicle giving rise to that distressing lesion known as the boil or furuncle Furthermore should the cutaneous cells become at any time sensitized to one of these infective agents the lesion will assume the well known characteristics of an eczematous eruption

Some other points in the aetiology of these affections must be indicated Besides the obvious factors of debility and bad hygienic surroundings there are others that make certain persons specially liable to infections of this kind In the view of most dermatologists the seborrhoeic subject is particularly susceptible and herein doubtless heredity and habits play their respective parts - Whereas the skin of a person in perfect health is remarkably free from germs in the case of the seborrhoeic person the wide-open lumina of sebaceous follicles generally teem with the acne bacillus the pityrosporon and the *Staphylococcus albus* Although these are usually benign in character they undoubtedly prepare the soil for invasion by more active organisms The scalp is a region particularly affected in this manner hence infection can readily spread by contact from it to the external ear Again in my experience the fair skinned person is more liable to skin eruptions than the dark and to exhibit any allergic manifestations

Another factor is the initial lesion in the skin surface that allows the entry of organisms This can be brought about in many ways—for example from irritation caused by dirt about the crevices and folds of the auricle wax in the meatus or a chronic suppurating discharge from the middle ear Direct injury also plays its part, and we have all seen the result in a perichondritis of the pinna or a spreading erysipelas after plastic operations on the cartilaginous meatus Perhaps however the commonest cause of the initial lesion is the imprudent use by the patient himself of a finger nail a match stick or some such implement to remove wax from his ear or to allay an irritation set up by the latter or consequent upon the local congestion produced by a chronic tubal and middle-ear catarrh themselves the result of some irregularity in the nose or nasopharynx The medical attendant too may be to blame as when he uses too irritating a fluid or makes unskilful attempts to extract a foreign body from the meatus and without due care for asepsis Finally let us mention in passing since we cannot discuss them here such obscure aetiological factors as age incidence heredity environment, immunity cell sensitization the allergic condition and the virulence of the invading organism and its saprophytic or parasitic qualities

Varieties of Otitis Externa

We can now enumerate the commoner clinical varieties of otitis externa and mention a few of the more important details which help us to recognize them

OTITIS EXTERNA CIRCUMSCRIPTA OR FURUNCLE

A furuncle begins in a pilo-sebaceous follicle hence this lesion is confined to the outer or fibro-cartilaginous portion of the meatus The causal micro organism is usually the *Staphylococcus aureus* or *albus* although occasionally a pneumococcus may be found It is an acute condition beginning as a tender spot quickly followed by pain and tenderness which may become of an e cruciating character There may be one furuncle or more than one and there is a great tendency to recurrence If we can see the actual localized swelling or swellings in the meatus and at the same time a tympanic membrane that shows little or no acute signs of inflammation the diagnosis is easy and certain This however is not so in severe cases or in those associated with an eczematous condition when the swelling may be so great as to close the canal and prevent a view of the tympanic membrane Then the case may be mistaken for one of acute mastoiditis with perimeatal oedema or, especially if the inflammation has spread to surrounding structures behind the ear oedema or even an abscess over the mastoid region In such cases an anaesthetic may be necessary to allow of adequate inspection of the drumhead or of an incision being made over a post auricular swelling in order to determine whether the pus is superficial or deep to the periosteum Furthermore, we must not forget that a furunculosis may coexist with an acute mastoiditis or be confused with a parotid abscess that has discharged into the meatus

OTITIS EXTERNA DIFFUSA

This also is an acute condition and comprises a number of different infections The signs and symptoms resemble those of furunculosis but are generally more severe and the canal in its entire length is more or less inflamed The invading organism is usually a streptococcus (sometimes the erysipelas variety) or it may be the *Bacillus pyocyaneus* the Plaut-Vincent organism or very rarely that of diphtheria In many of these infections the acute diffuse meatitis affects the surface of the tympanic membrane as well as the walls of the canal and may be recognized in its various stages—namely, first a stage of desquamation with superficial swelling and serous discharge secondly a stage of deep swelling involving the perichondrium and thirdly a stage of suppuration Many textbooks still mention a croupous form of otitis externa in which a coagulated fibrinous membrane is repeatedly thrown off in the form of casts of the inner part of the canal and drumhead Its aetiology was never definitely known and it is doubtful if it is now ever seen A true diphtheritic membrane however, remains a possibility and although exceedingly rare it should be borne in mind whenever a diffuse otitis externa appears without obvious cause in a child who has a diphtheritic affection in the nose or throat

OTITIS EXTERNA MYCOTICA (OTOMYCOSIS)

Various fungi may gain entrance to the external auditory canal and there set up inflammatory reactions Among them may be mentioned the pityrosporon and the aspergillus The former is said to be perhaps the commonest cause of an infective meatitis This may appear clinically as no more than a non inflammatory scaliness comparable to ordinary dandruff of the scalp It may however be followed by a definitely inflammatory seborrhoeic dermatitis Its importance lies in the fact that it seems to prepare the way for further invasion by other organisms—for instance by the *Staphylococcus albus* and *aureus* which may lead to meatal boils or by the streptococcus which is likely to produce impetiginization with fissures at the angles of the meatal orifice (Barber) Eczematization also readily occurs

In the case of the aspergillus the fungus may simply inhabit the meatus without causing any morbid changes in the tissues upon which it grows thus giving rise to no symptoms except perhaps a slight impairment of hearing If however the tissues become invaded the mycelia perforating the lining membrane of the bony canal and the skin covering the drum membrane an acute inflammatory process arises The germ appears to require warmth and

had acquired, through the generosity of Mrs Meyer Sassoon, a high-voltage *x*-ray apparatus whose maximum output was a million volts There had been certain changes in the governing body Lord Stanmore had resigned from the office of treasurer, which he had held for sixteen years During the last few days the clerk to the governors, Mr Thomas Hayes, who had served the hospital for thirty-two years, had retired he had endeared himself to all by his personality and had maintained cordial relations between the medical staff and the governing body From the staff Mr R C Elmslie had retired at the beginning of the year, and Professor H H Woollard had gone to University College They had to congratulate Mr Girling Ball on being appointed dean of the Faculty of Medicine in the University of London, which had recently increased its annual grant to the school by £3,000 Congratulations were also due to Dr Robb Smith on his appointment as assistant director of pathology at Oxford, and to Mr W E Underwood on winning the Jacksonian Prize for 1936 and on being appointed subdean of the College Dr Hinds Howell also referred to the loss St Bartholomew's had sustained in the deaths of Mr T Just and Professor E H Kettle Work was, he continued, now in full swing in the new building, but he would like to remind them that they still owed the Merchant Taylors Company something like £60 000 Much yet remained to be done for the *x*-ray department, and Bart's was still without a private patients block They were in need of a residential college, at a cost of £50 000 They urgently required money for research Altogether at least £250,000 was necessary to put the hospital on a sound footing, and he hoped that benefactors would help them to solve this financial problem

The health of the guests was proposed by Mr Reginald Vick and responded to by Mr George Aylwen and a pleasant evening was drawn to a close by Mr R Foster Moore who proposed a toast to the Chairman, which was received with acclamation

Dr Wilson in his reply, said that the pleasure he enjoyed as dean was not so much as a result of any success of policy, but rather as a result of the careers of those whom he had been mainly responsible in bringing to the medical school It was interesting to find now some justification for the games policy inaugurated in 1920 in the interests of the boys who, after leading healthy outdoor lives, had been dumped down in a great city It was difficult to explain the vehement opposition that had been stirred up in the breasts of some of the other schools They at St Mary's had been accused for years of taking too much exercise, but now in the physical fitness campaign the whole nation was being told that it did not take enough, and elderly gentlemen who had given up their lives to the acquisition of wealth were busy in the Press and on the platform explaining to the proletariat how really essential exercise was to a sound healthy life and sane outlook

Responding to the toast of his health, Mr Zachary Cope said there was a great sentiment of loyalty to St Mary's, but they would need that spirit of 'sticking together more than ever in the future They were at the moment on the crest of a very big wave, in every department there was progress and excellent and amicable relations existed between the School and the Board under the chairmanship of Colonel Verey, who with his fellow members, was most helpful in every way Paying tribute also to Colonel Parkes the house governor and to the dean of the school, Mr Cope said that with such people at its head St Mary's would continue to prosper, but, unless there was maintenance of the sentiment which had animated those concerned in the past the future would hold many problems The State was going to take an increasing part in all their doings It was necessary in order to be able to withstand the attacks not only on hospitals but on medical schools, that there should be a feeling of loyalty throughout every institution He believed St Mary's would weather the storm, standing as one united hospital four-square to all attacks

ST MARY'S HOSPITAL

Past and present students of St Mary's Hospital Medical School met to dine at Claridge's on October 2 Mr V Zachary Cope surgeon to the hospital, presided

Dr M W Lloyd Owen in proposing the toast to 'St Mary's Hospital Medical School said that he had the highest admiration for the way in which Dr C M Wilson, whose name he coupled with the toast had devoted his life to the welfare of the medical school Outward and visible signs of Dr Wilson's achievements were to be seen in the medical school building itself and more recently in the magnificent ground at Teddington, which had been used that afternoon for the first game of the rugby football side Generally in the sphere of athletics the school had held its own The hospital itself had recently made distinct progress Evidence of this was to be seen in the new nurses' home and the pay-block The Lewis Carroll ward for children, consequent on a magnificent gift by Mr Harben was rapidly nearing completion It would contain twenty-two ordinary cots, and the very important provision of four observation cots, which would prove a godsend to the harried house physician in dealing with the difficult problem of the child in casualty with pyrexia They were all now looking forward to November 10, when the Queen was to pay the hospital a visit and open the pay-block Dr Lloyd Owen also paid tribute to the generosity of Mr Meyerstein in providing a research dental laboratory, and, concluding on the note on which he had begun said as long as the hospital had a man of such character and foresight as the dean at the helm to guide its endeavours there need be no fear as to the future

NATIONAL HEALTH CAMPAIGN

INAUGURATION BY THE PRIME MINISTER

The Prime Minister, Mr Neville Chamberlain inaugurated the national health campaign at a reception held by the Central Council for Health Education at the London School of Hygiene and Tropical Medicine on the night of Thursday, September 30 Sir Kingsley Wood the Minister of Health presided at the meeting and Mr Arthur Greenwood, Lord Horder M D Sir Percy Harris, and Mr H J Scrymgeour Wedderburn Under-Secretary of State for Scotland, also spoke in support of the campaign Those on the platform included Lord Stanhope, President of the Board of Education, Lord Addison, M.D, Dr James Fenton, Chairman of the Central Council, Lord De La Warr, Lord Kennet, and Lord Aberdare. The Prime Minister was received by the Mayor of Holborn, the Dean of the School (Professor W W Jameson, M D) and Dr Fenton Lord mayors, mayors, chairmen of county councils chairmen of district councils representatives of the medical profession, and others interested in the work of the health services were present at the reception

MR CHAMBERLAIN'S ADDRESS

In the course of his speech which was broadcast from the library on the National wave-length the Prime Minister said-

To understand what moves us to this effort we must think not of the national health as an impersonal abstract thing but of the people who compose the nation, the fathers and mothers who carry the responsibility of bringing up a family, but to whom, unless they have health,

"BUTTONHOLED" EXTENSOR EXPANSION

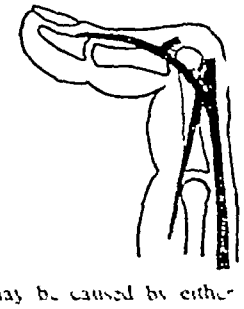
BY

D L C BINGHAM, F R C S Ed

AND

E A JACK, F R C S Ed

Clinical Tutors Surgical Out patient Department Edinburgh Royal Infirmary



Injuries to the tendons which govern the delicate movements of the fingers are all potentially serious as regards subsequent function and each particular injury demands its own appropriate treatment Certain of these injuries are rare and therefore when they occur may not be recognized Delay in their treatment frequently leads to disability which may be avoided or at least minimized by immediate repair

It is because of the rarity of buttonholed extensor expansion and the necessity for operative repair that we wish to draw attention to the condition During the last year we have seen three cases of this injury amongst a large number of conditions of the hand and fingers

The extensor tendon to a finger as it reaches the metacarpo phalangeal joint spreads out into an apo neurotic sheet which covers the proximal phalanx and divides into a central and two lateral bands The central band is inserted with the dorsal ligament of the proximal interphalangeal joint into the base of the middle phalanx The lateral bands pass distally one on each side of the proximal interphalangeal joint and then converge to be inserted with the capsule of the distal interphalangeal joint into the base of the distal phalanx The interosseous and lumbrical tendons pass from a more volar plane to fuse with these lateral bands just distal to the metacarpo phalangeal joint

Aetiology

'Buttonholed extensor expansion is an injury which consists essentially of a rupture of the central band of the tendinous expansion as it passes over the proximal interphalangeal joint The two lateral bands are thereby deprived of their supporting intercommunication and when flexion occurs at this joint they dislocate volarwards one on either side of the joint the displacement being increased by the pull of the lumbrical and interosseous tendons At the same time the head of the proximal phalanx protrudes through the rent in the central band and capsule (see figure)

The injury may be caused by either direct or indirect types of trauma

A Direct Trauma—(1) A cut wound over the flexed proximal interphalangeal joint may divide the central band of the extensor and the lateral bands being protected by the convexity of the knuckle (Case 1) (2) A sharp blow over the flexed knuckle may be sufficient to divide the central band by nipping it against the head of the proximal phalanx (Case 2)

B Indirect Trauma—Sudden forced passive flexion occurring in an actively extended finger with the extensor tendon taut may rupture the central band just proximal to its insertion into the base of the middle phalanx (Case 3)

Clinical Features

The clinical features of these cases are easily recognized There is a history of trauma The proximal interphalangeal joint is swollen and tender and the finger assumes the characteristic attitude of extension at the distal and flexion at the proximal interphalangeal joint If extension of the finger is attempted hyperextension of the distal phalanx occurs but as the lateral bands have passed forwards to the volar side of the axis of the joint and the central band has completely lost its purchase on the middle phalanx slight increase in flexion takes place at the proximal interphalangeal joint Passive extension is usually almost complete and the position can be maintained but not against resistance and as soon as flexion occurs the finger becomes once more fixed in the position of the deformity

Treatment

The treatment is straightforward and should be undertaken immediately Delay leads to lengthening of the central band by fibrous tissue and liability to the subsequent loss of full extension Under a local anaesthetic the tendon is exposed through an L shaped incision The head of the proximal phalanx presents through the tear in the central band and the displacement of the two lateral bands is obvious The finger is straightened and the metacarpo phalangeal joint flexed and after approximating the torn edges of the central band with fine interrupted sutures the two lateral bands are splinted back with one or two transverse sutures passing from one to the other across the central band This counteracts the pull of the lumbricals and interossei and prevents the forward displacement The wound is closed and the finger fixed in full extension in a light plaster for four weeks Thereafter a short course of active exercises soon re establishes mobility

Case Histories

Case 1 (male aged 15)—While sharpening a scythe the patient received a small cut over the proximal interphalangeal joint of his right index finger The finger became flexed and he was unable to straighten it Ten weeks later he was seen because of persistent deformity and loss of extension Operation revealed a rent in the central band and dislocation forwards of the lateral bands the gap being filled with scar tissue This was dissected out and the tendon repaired with waxed silk thread The finger was splinted in extension for sixteen days and then active movements were started Six months later there is still 45 degrees limitation of extension though movements through the rest of the range are free The disability is no doubt due to an insufficiently long period of immobilization after operation with subsequent stretching of the suture lines The result is not satisfactory and further repair has been advised

Case 2 (male aged 81)—This patient was knocked down by a motor car and received among other minor injuries a sharp blow across the knuckles of his right hand The skin was not broken but he found he was unable to straighten the index finger which presented the typical features described Operative treatment was carried out three days after the injury and fixation of the finger was maintained for four weeks Two weeks later extension was limited by only 10 degrees while flexion was limited by about 15 degrees As there was considerable disability from arthritis in the other fingers the result was considered good

Case 3 (male aged 71)—The middle finger of this man's right hand was caught in the fastening of a coat as it

and mainly through the local authorities, who have responded to the idea of the campaign with the greatest enthusiasm Each month is to be devoted to some special subjects so as to obtain the greatest amount of concentration Thus October will be given to a general introduction, November and December to maternity and child welfare services including ante natal clinics, January to the school medical and dental services and to milk in schools, February to tuberculosis and venereal diseases Up to this point we shall be dealing with services designed either to cure or, better still to prevent disease But in the last month of our campaign we shall come to the latest but not the least important of all our efforts to promote the national health I mean our new plans for stimulating and encouraging physical development Here we shall be dealing not only with school children but also with young people who have left school and are passing on to maturity I am afraid that in this matter of physical development some other nations, and especially Scandinavians have got ahead of us but now that we have realized its importance I am confident that we shall not be long in making up for lost time and showing that *we do not mean to be left behind And so in March* the National Advisory Council for Physical Training will take up the theme describing the new facilities for physical exercise and recreation and demonstrating how it can contribute to the enjoyment of life and to greater efficiency of mind and body

LORD HORDER'S SPEECH

Lord Horder discussed the doctor's part in the national campaign for a healthier Britain and emphasized the importance of enlisting the aid of hospitals provident associations and every other health agency, in addition to the health services proper

There is no question of the willingness of the doctor to help But when I think of how the doctor can help I am faced with a less easy task The doctor, of course can give lectures demonstrations, answer questions at public meetings He makes himself familiar with the health services, and does his best to see that his patients avail themselves of these services But the best things he does are not these The best things are the things that enter into his daily routine whether he be what is called a general practitioner or a specialist The doctor works at the periphery Your health services—and I agree with the Prime Minister that they are the best in the world—operate in the centre It is the doctor who makes contact with the human material for whose benefit the health services exist It is the doctor who deals with the individual As the Prime Minister has stressed, it is to the individual that this appeal must ultimately be made That is if you have decided as thank God you have, to achieve national fitness without regimentation

The Doctor a Vital Link

"At the periphery there are difficulties which the centre does not always experience To get your benefits across, the doctor provides a link that is vital He more than any one else knows if the machine really works and where if it does not the trouble really lies Too often the doctor finds the individual muted by worry He finds him static in regard to his own interests in the matter of health finds him bewildered, it may be, by the mass of official chits and sanctions find him hostile at times How wise you are Mr Prime Minister to invoke the aid of the doctor The doctor has this tremendous pull—he is the friend of the man woman and child you seek to help and he has their entire confidence

But the doctor was human and needed encouragement continued Lord Horder The fight was not only waged against disease and unfitness but also against economics He was thinking not only of the excellent army of medical officers of health but of Drs Smith Mackintosh Jones the rank and file holding the field

Need for a Wider Appeal

"If your call to the nation to better health is limited to a fuller use of the health services the response will fall short of your desire You Mr Prime Minister, and your colleagues have I know, some reason for concentrating on this aspect of the problem in the first instance, and I think you are right I think it is right to deal with the things we have and to see that they are properly used before dealing with things which may be for the moment visionary But you have promised us that you will enlarge this appeal not only in the direction of implementing the Act through which grants are being made towards physical training There is this basic matter of food, by which I mean enough food and the right food We doctors are deeply concerned and involved in this question

Lord Horder said that he was glad that it was recognized that there were a large number of agencies other than the health services proper which must be co ordinated in the service of the campaign The hospitals both voluntary and municipal the universities and research institutes the public medical services and the provident associations were the media through which the Prime Minister with his leadership, could enable the doctor to pull his full weight If he were to specify one medium more than another for ensuring an abundant return for the courageous efforts being made he would choose that of closer co operation and consultation between the local authorities and the doctors who were face to face with the domiciliary and individual problems relating to health

THE CAMPAIGN IN SCOTLAND

Mr H G Scrymgeour-Wedderburn M P, Under Secretary of State for Scotland launched the Government's national health campaign in Scotland by a broadcast talk on October 1 He said that Scotland had some special problems The people of Scotland were healthier now than at any time in their history, but although great progress had been made other nations had made even greater progress, for the Scottish death rate was higher than that of England and Wales and of several other countries while the infant death rate last year was 82, as compared with 59 for England and Wales There was far too much sickness among the people, and too small a proportion of men and women enjoyed the happiness that should come from perfect health The first problem in Scotland was maternity and infant welfare Next the problem of chronic sickness in the insured population was to be investigated by all the medical practitioners in the country Education of the public in healthy living was to be pursued with the help of the family doctor, welfare centres, schools and schemes for physical training and recreation The health services in Scotland, built up by the efforts of the Government the local authorities, and the medical profession and costing many millions of pounds every year had done great work, but they could do greater work still, and for this it was essential that the people should use those services to their fullest possible extent The Empire Exhibition which would be opened in Glasgow next spring would provide a rallying point for the progress of this health campaign in Scotland but if its results were to endure continuous patient effort was needed Doctors could help in sickness and could advise what should be done to keep well The organized community could provide decent social conditions and services but health remained very largely a way of living, and in the end it was for the individual to lead the healthy life

---

Dr M von Pfaundler, professor of children's diseases at Munich and conjoint editor with the late Professor Schlossmann of the well known *System of Children's Diseases* has retired from his chair and been made emeritus professor

lesions My attention was drawn to one important factor the collars of these workers often become encrusted with a mixture of dried sweat and slaked lime which has a marked abrasive effect and often contributes to the development of lesions on the neck The frequent changing of the collar and the use of strips of lint however greatly reduce the damage

It is stated by Antonibon (*Bollettino di Oculistica* April 1931) that lime in the eye is damaging both by reason of the hydroxyl ion which causes colliquation of the corneal tissue and also by the action of the calcium ion which in the first place is adsorbed on to the protein particles It is likely that similar changes occur in raw areas of the skin created by and subsequently exposed to lime Therefore it is not surprising that such sores are slow to heal and this fact should incite one to use all possible preventive measures

Several reports have been received from employees describing the benefit they have derived from talc used in this manner

Clinical Memoranda

Epidemic Catarrhal Jaundice in School Children

A very interesting account of this disease written by Dr Lisney (1937) appeared in the *British Medical Journal* of April 3 last It referred to an epidemic in Leicestershire in 1936 Some further notes of an epidemic in Gateshead may be of interest The epidemic seems to be similar to the one described by Dr Lisney and to those referred to by Morgan and Brown (1927) in their account of the disease At first it was confined to the children in one school but now several other children have been attacked in various parts of the town Up to the present thirty-one children have been affected in the school in which the outbreak commenced and thirteen in six other schools

Incidence

Forty four cases have been investigated and all of them are children of school age except two children too young to go to school and one parent So far as I know this is the only adult who has been infected in the present epidemic Of the forty-one school children fourteen are boys and twenty seven are girls and the following table shows the age incidence

Age	Male	Female
5	2	3
6	2	7
7	3	5
8	–	4
9	4	5
10	1	2
11	2	1
Total	14	27

There were only two instances where more than one member of a family was infected In one of these a school child infected her younger sister and her father

The epidemic began on January 13 1937 and still continues (September 25) although fewer cases are now being notified There is no reason to suspect that the milk or water supply is at fault The public water supply is filtered and chlorinated and is above suspicion The school milk supply is pasteurized and conforms to the tests for pasteurized milk It is from the same source as in other schools which are not affected by the epidemic

All the evidence points to infection by personal contact It is difficult to estimate the incubation period The first child to contract the disease left school on January 13 and the second on January 26 After that cases occurred at intervals of three or four days until nineteen children had been affected Cases Nos 19 and 20 give some indication of the probable incubation period for No 19 left school on March 8 and No 20 (who could not have been in contact with No 19 after that date) contracted the disease on April 6 (twenty nine days after) which agrees with the period of one month given by Dr Lisney

Symptoms and Signs

All the cases so far have been slight The onset is gradual and at first the child complains of slight abdominal pain with sometimes nausea and loss of appetite After five or six days vomiting occurs this has been present in all cases and in many of them it was very severe There may or may not be a rise of temperature A day or two after the vomiting attack jaundice appears first in the conjunctivae and then spreading to the skin of the face neck trunk and limbs according to the severity of the illness In some cases it is limited to the eyes and face In severe cases there is itchiness of the skin When jaundice appears the faeces become very pale and the urine dark After about a week the jaundice disappears and the patient is quite well In nearly all the cases seen the patient when convalescent was stated to eat ravenously There were no complications

Bacteriological Investigation

The faeces of seven cases were examined but revealed nothing of importance except that in one case an atypical non lactose fermenting organism was found In this case the sample was taken before the appearance of jaundice The urine of two cases was inoculated into guinea pigs but in neither case did they show signs of jaundice and no leptospira were found Bacteriological examination of milk supplied to schools revealed nothing of importance

Summary and Conclusions

The present epidemic in Gateshead is similar to those referred to above The disease occurs chiefly in children aged 5 to 10 years and is spread by personal contact The incubation period is probably about four weeks The premonitory symptoms are often slight and during this period when the child is still at school he is apparently infectious to others, and it would seem advisable that during an epidemic all school children who have attacks of vomiting should be kept at home for four days to see if they develop jaundice

The above brief account of epidemic catarrhal jaundice at present attacking children in Gateshead is published in the hope that others may also give details of epidemics of the disease in their districts and particularly in the hope that some method of investigation may be suggested which would lead to the discovery of its causal organism

I am greatly indebted to Dr J Grant medical officer of health for Gateshead for permission to publish this short account of the present epidemic of catarrhal jaundice in that town

Bertram Sergeant M B B.S., B Hy.,
Chief Assistant School Medical Officer and Assistant Medical Officer of Health
Gateshead

ENGLAND AND WALES

Tuberculosis in Wales—Committee of Inquiry

The Minister of Health has sent a letter to Lord Davies, as president of the King Edward VII Welsh National Memorial Association, announcing the appointment of a small committee of inquiry into the working of the arrangements for the prevention, treatment, and after-care of tuberculosis in Wales The appointment of this committee was foreshadowed by Sir Kingsley Wood during his recent visit to South Wales His letter states that Mr E Clement Davies, K C, M P, has agreed to act as chairman, and Dr F J H Coutts, C B, as the other member Dr Coutts was for many years a senior medical officer of the Ministry, and has had long experience of the administrative and other problems connected with tuberculosis The secretary of the committee will be Mr D J Wildgoose, Ministry of Health, Whitehall, S W 1 The terms of reference of the committee are

To inquire into the working of the arrangements for the prevention, treatment, and after-care of tuberculosis by local authorities in Wales and Monmouth through the agency of the King Edward VII Welsh National Memorial Association and otherwise and to advise whether any, and, if so what steps should be taken to improve these arrangements and in particular whether and in what respects the scheme made under Section 102 (3) of the Local Government Act 1929 for the Third Grant Period should having regard to the cost of public health services in Wales be amended

Tuberculosis in Manchester

The report for 1936 on the health of Manchester records that the notification and death rates for tuberculosis during the year constituted a low record figure Although notifications of non-pulmonary forms of the disease show a very slight diminution, the main decline is in pulmonary cases This decline has now been continuous for five years The report stresses the importance of proper treatment at the earliest manifestation of the disease Delay is especially noticeable in patients of the age group from 65 onwards Thus in this group there exist a large number of active, chronic tuberculous individuals who constitute a potential source of infection to their families Efforts are being made to secure the examination of contacts of such patients, especially the young adults The report deplores the valuable time lost because patients frequently resort to nostrums advertised in the lay press before visiting a doctor The clever pseudo-medical advertisements of these remedies are characterized as mischievous and dangerous Although the year was somewhat unfavourable for other respiratory diseases, the death rate from pulmonary tuberculosis was only 0 87 per 1,000 The effect of fog on persons suffering from pulmonary tuberculosis was very definite, with the coming of the first fogs the deaths from this disease increased rapidly For example, in the January and February fogs the deaths rose from an average of 14 during the preceding weeks to 15 18, and 20 per week Again, in two spells of fog in the autumn the figures of 16 and 24 deaths per week were reached The average weekly death rate for the whole year was 13

Health Aspects of Smoke Abatement

Coincident with the start of the campaign for improving the health of the British nation came the ninth annual conference of the National Smoke Abatement Society at Leeds last week In his presidential address on October 2 Dr H A Des Voeux urged the reiteration of the ancient Greek ideal of clean and open cities freed from slums on earth and polluted atmospheres He recalled that coal was not used in England before 1239, and that conditions had grown worse with advancing industrialism and inadequate sewerage Mr J E Acfield indicated the importance of considering the location of high-power electricity generating stations when residential centres were being planned He added that only three of thirty new buildings of any magnitude erected since April 1930, in the central area of Leeds used raw coal as fuel, and this had been brought about without the corporation having had to exert any pressure There were now in that city 4 200 new dwelling houses and cottage flats equipped with ranges specially designed for burning coke, and all buildings now being erected on housing estates were being so furnished Ventilation problems in such cases had as yet not been entirely overcome, and gas fires presented difficulties in this respect as well as in regard to the cost of gas Mr Charles Gandy, chairman of the executive committee, pleaded for smokeless zones in towns as being a primary obligation of the town planner Dr R Veitch Clark, medical officer of health for Manchester thought that the existing legal powers were not being utilized enough Only a statutory smoke board for a regional area could secure effective administration, and he called attention to the parallel in the case of joint river boards Dr Matthew Burn, deputy medical officer of health for Birmingham, discussed the work of statutory and advisory committees, pointing out that a great deal more could be done with the powers already available Close and effective co-operation with manufacturers would be of great value in achieving the objective of a cleaner atmosphere Councillor W Asbury chairman of the Sheffield, Rotherham, and District Smoke Abatement Committee, explained how research had rendered certain metallurgical processes nearly smokeless, low-temperature furnaces were only successful when using gaseous fuel and electricity, though progress had been made recently with the use of pulverized coal Dr W M Frazer, medical officer of health for Liverpool, mentioned the fear that smoke by laws might discourage new industries, and stressed the value of intensified education in respect of smoke abatement and fuel economy Successful classes were being conducted by the West Lancashire and Cheshire Regional Smoke Abatement Committee in collaboration with the Liverpool University School of Hygiene He thought that the mass rate of emission of pollution from domestic smoke required more forcible action, and that the time had come to organize a national effort to promote smoke abatement Dr J Johnstone Jervis, medical officer of health for Leeds, described what had been done in part of the West Riding as illustrating what could be achieved under the existing legislative powers, the greatest source of discomfort had been found to be the older and more obsolete coal-mining plants

AUSTRALIA

A Febrile Disease in Queensland

The annual report (1936–7) of the Walter and Eliza Hall Institute of Research in Pathology and Medicine, Melbourne, contains observations on what appears to be a new disease In the course of the last three years some thirty cases of febrile disease have been observed in Queensland The fever does not conform to any of the usual clinical types, nor has investigation along orthodox bacteriological lines established its aetiology The disease has been provisionally termed ' Q fever,' while Queensland rickettsial fever is also suggested as a suitable name The local investigator of the cases, Dr E H Derrick, found that a mild febrile reaction occurred in guinea-pigs inoculated with blood taken from a patient at the height of his fever This guinea-pig fever was indefinitely transmissible in the guinea-pig by blood or liver emulsion, but no pathological changes could be detected After recovery the animals proved to be immune both to infective guinea-

cannot be measured Most readers have heard of Schliephal e s successes when he first used short waves in local pyogenic infections Dr Cumberbatch has treated a relatively small number of cases of superficial disease with short waves and diathermy and has come to the conclusion that there appears to be very little difference in the results but in more deeply situated diseases short-wave treatment is definitely more successful Inducto thermy is the most recent of the electrothermic methods and it is proving to be the best method of inducing artificial fever as it is much safer and less irksome for the patient and safer for the operators The remaining third of the book is concerned with surgical electrothermic methods and includes a chapter by the late Dan Mackenzie on destruction of the tonsils by diathermy, one on the treatment of malignant disease of the upper air passages by Douglas Harmer and one by Kenneth Walker on electrothermic methods in prostatic obstruction

The book is illustrated by photographs and diagrams and has for frontispiece a portrait of Arsene d Arsonval now in his eighty sixth year who has happily lived to see the widespread application of diathermy and its far-reaching benefits resulting from his years of patient research work

THE SURGERY OF PAIN

La Chirurgie de la Douleur By R Leriche (Pp 428 18 figures 65 fr) Paris Masson et Cie 1937

This book by Professor René Leriche is an indexed monograph of some four hundred pages, dedicated to the memory of Charles Nicolle and based on twenty lectures given by the author in the College of France at the request of M Nicolle The preface which consists of fifteen closely printed pages pays tribute to the pioneers in the surgery of pain Horsley Weir Mitchell Abbé Spiller Frazier Cushing van Gehuchten Krause Thiersch Foerster Jonnesco and others In France Professor Leriche singles out three men who have made important contributions—namely Jaboulay Chipault, and Sicard He points out how pain varies according to the temperamental type of the afflicted subject and cites the different reactions seen during the great war in men of different nationalities The men of Napoleon s Grande Armée were apparently but little affected by the pain of their wounds and certain Cossacks during the great war remained quite quiet and unperturbed while they had amputations performed without the use of any anaesthetic Leriche distinguishes two varieties of pain one fixed and related to nervous innervation the other vague and ill defined and associated with vasomotor and trophic disturbances It is with this latter type that so much of his surgery of the sympathetic nervous system has been concerned

The nineteen chapters of which this monograph consists are devoted to pain in various anatomical sites and to questions of its relief Each chapter is made up of a series of sections with subheadings These are well separated from each other and each is complete in itself so that references in the index are readily found and are for the most part single The author states that because of the many complications following chordotomy he performed in 1925 a new operation section of the median commissure of the spinal cord but he has apparently overlooked the fact that Dr Greenfield at the National Hospital Queen Square had suggested this operation some time before this and in December 1926 the late Mr Donald Armour had performed it before the Hunterian meeting of the Society of British Neurological Surgeons which took place during that month in London All Leriche s work however has been less concerned with the somatic than the sympathetic nervous system and in this volume we find a very full survey of his many contributions

The book is written with all the vigour and enthusiasm of the director of the surgical clinic at Strasbourg Two of the most interesting chapters are those on angina and on the nature of physical pain Illustrations are scanty but for the most part clear and demonstrate the points made in the text We should like to have seen some more reference to the work of British neurologists and particularly to Mr Wilfred Trotter s contribution to our knowledge of peripheral pain Those interested in the afferent side of the sympathetic system cannot afford to overlook this monograph

HEALTH PROPAGANDA

Health Education of the Public A Practical Manual of Technic By W W Bauer B S M D and Thomas G Hull Ph D (Pp 227 illustrated 12s net) Philadelphia and London W B Saunders Co 1937

People in this country who devote themselves to advancing the cause of health must find interest from time to time in comparing their own methods with those adopted by workers in other lands who are engaging the same problem with equal sincerity but under conditions which almost inevitably, are widely different All such we feel sure will derive guidance together with some entertainment from the book on the health education of the public in which two distinguished members of the American Medical Association show how in their experience the population of the United States may be brought to realize the value of health We have found nothing in the book from which having regard to the differing circumstances we feel disposed to dissent We entirely agree that two health talks a day on the wireless are too much also that slovenly health exhibits are worse than no exhibits at all also that the personality of the missioner may often make or mar the message he seeks to convey We have been interested to learn that some health expositors in America test their pamphlets before issue on ten year old children believing that on this plan they are able to strike a standard which will be within the comprehension of any adult! Among other avenues explored are the public meeting the newspaper the cinema the lantern slide, and the magazine Under the title Miscellaneous Devices the authors refer with toleration though without enthusiasm to the plan of giving a child a shining blue button on which are printed the words I am Schicked Are you? We commend the book to all who have to do with adult health education

DICTIONARY OF APPLIED CHEMISTRY

Thorpe s Dictionary of Applied Chemistry By Jocelyn Field Thorpe C B E D Sc F R S F I C and M A Whiteley O B E D Sc F I C Fourth edition Vol I A B (Pp 703 (3s net) London Longmans Green and Co 1937

We welcome the first volume of the fourth edition of *Thorpe s Dictionary of Applied Chemistry* which is appearing under the editorship of Professors J C Thorpe and M A Whiteley This dictionary has been a standard work of reference for many decades and the need for an encyclopaedic book of this type has been increased by the rapid development of the subject in recent years The last volume of the third edition appeared in 1927 and two supplementary volumes were issued in 1933 and 1935 The new edition has been completely remodelled and rewritten It consists of monographs on selected subjects

Anaemia of Hepatic Cirrhosis

Sir—I was interested in the annotation (*Journal*, September 25, p 628) on the anaemia of hepatic cirrhosis especially in the statement that 'it seems unlikely that the part played by the liver is passive or that it acts merely as a storehouse for material elaborated in the intestinal tract Some years ago I showed that an important sequela of iron deficiency in pigs was a macrocytic anaemia associated with great destruction of the central areas of the liver lobules In extreme cases every lobule was affected and to the extent that the liver tissue remaining consisted of a single layer of liver cells at the periphery of the lobules Recovery was possible however, and there was the most dramatic rise in the percentage of haemoglobin and in the red cell count on the administration of even a single dose of liver extract (Incidentally I suggested that such cases be employed for the purpose of standardizing liver extract) I recognized at the time that such a result was presumptive evidence of the existence of a function by which the liver elaborated a 'forerunner substance' produced in the intestinal canal by the interaction of the intrinsic and extrinsic factors but that this point could only be finally settled by the administration of dried stomach tissue when a negative result would be expected to follow on the present hypothesis Unfortunately, for reasons which need not be gone into here, I have not had the opportunity of carrying this out, so that it must be left now to someone in more fortunate circumstances, or alternatively to those having at their disposal suitable cases of cirrhosis of the liver in human beings

The annotation goes on to say that "the mechanism of pernicious anaemia is more complicated than was at first realized I imagine that the unravelling of this complexity would be greatly facilitated by a recognition of the essential difference (and its implications) that exists between macrocytic and megalocytic anaemias Absence of liver agent in cases in which the marrow is organically sound and healthy leads to a macrocytic anaemia, a condition from which the patient can recover in pernicious anaemia, however, the bone marrow is organically diseased and functioning on an early primitive red blood cell formation basis—that is, a megalocytic one The absence of liver agent in this case (brought about as a consequence of the disease—on this point see, for example, Castle and Minot's book on the anaemias 1936) keeps the blood formation on this early basis with an inevitable fatal issue unless this substance is artificially administered when amelioration takes place, blood formation still however, remaining primitive and never becoming definitive in type The rationale of the views just expressed is fully discussed elsewhere (*Edin med J* 1935, **42**, 293) and space would not allow of its adequate treatment here—I am, etc,

Aberdeen Sept 25 J P McGowan

Giant-cell Tumours of Bone

Sir,—I sent Mr Osborn's letter with its criticism of surgery and ardent advocacy of *x*-ray therapy of giant-cell tumours to Dr T Campbell Thompson of New York, asking for his comments In order to be brief, I may say that his feeling is that the treatment by surgery is more reliable and causes less loss of function than treatment by x rays

In his opinion there has been something like 20 per cent loss of function in the joints treated by surgery as compared with 50 per cent or more in those treated by x rays I saw one case of a hip-joint in which there was entire loss of cartilage and joint space as seen in the *x* ray and almost complete loss of motion I saw one case of a giant-cell tumour at the ankle-joint in which the x-ray treatment was sufficient to arrest the tumour but caused such severe skin changes that a chronic intractable oedema of the foot developed which eventually required amputation All of our men here who have seen cases treated by x rays feel the same way—that the dosage required for arrest of the tumour is almost sure to cause irreparable changes in the joint close to which the tumour almost invariably lies The results from operation are quite uniformly good unless the operation is done carelessly and closure done poorly or if infection results

I think that Mr Osborn's letter is very well written, but he apparently is not sufficiently cognizant of the poor results and the complications of x ray treatment

I feel that this letter is worth bringing before your readers—I am, etc,

Oxford Oct 2 G R Girdlestone

Endotracheal Anaesthesia

Sir—Mr Cecil Joll, in a letter published on October 2, disagrees with Dr Ivor Lewis's article citing thyroid surgery as a contraindication to endotracheal anaesthesia. While the opinion of such an eminent thyroid surgeon must be regarded with the greatest respect, we would venture to suggest that it is not the view at present held by the majority of surgeons and anaesthetists in regard to operations for toxic goitre

It so happens that one of us (C L H) has statistics covering a series of 2,000 thyroid operations for toxic conditions only, of which more than 700 were performed by the other (G L K) Half of this total were performed under endotracheal anaesthesia and the other half were not, so that we thought the results might be of sufficient general interest to mention briefly

The first series covered the period from 1920 to 1928, and the anaesthetic technique employed was at first insufflation with air–ether and later endotracheal inhalation with nitrous oxide–oxygen and minimal ether These methods were usually preceded by local infiltration with novocain

The second series, which has just been completed, started in 1929 with the avertin–N_2O–O_2 technique Most of these patients had in addition an infiltration with 0·5 per cent novocain and 1/500,000 adrenaline, though about 200 had only adrenaline–saline solution The comparative mortality figures are as follows

	Endotracheal Anaesthesia	Avertin +N_2O–O_2
Immediate mortality	1 (0·1 %)	0
Remote mortality (up to seven days from operation)	28 (2·8 %)	13 (1·3 %)
Total mortality	29 (2·9 %)	13 (1·3 %)
Deaths due to respiratory complications	14	3

In one of the patients who died from respiratory complications in the 'avertin' series, a condition of advanced asbestosis was discovered *post mortem* and if this one be excluded it will be seen that the respiratory mortality was seven times greater in the endotracheal than in the 'avertin" series We have no figures for non-fatal respiratory complications, but they are undoubtedly much lower in the second series The same surgeons operated throughout, and the surgical technique has not altered appreciably during the relevant period

If reasonable gentleness is employed by the surgeon both ether and endotracheal anaesthesia are quite unneces

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY OCTOBER 9 1937

THE HAEMORRHAGIC STATE

The fact of the clotting of shed blood is so much a matter of everyday common experience that it is accepted as a natural phenomenon without need for explanation though even lay people are aware that failure to clot may be followed by serious trouble in bleeders When the process is subjected to further investigation however it is found *to consist of a complicated series of physicochemical* changes the nature and sequence of which are by no means capable of clear description by physiologists When a break in the sequence occurs as the result of some inherent or added pathological defect a group of disease phenomena can be recognized known as the haemorrhagic state or haemorrhagic diathesis and a beginning of differentiation may be possible among this group Even without a clear pathological basis for differentiation a body of clinical experience has grown up empirically which enables a working classification to be adopted

The established facts of the physiology of blood coagulation are easily stated and are essentially those used by Morawitz in his theory of coagulation enunciated in 1904 The process consists of two stages first the formation of thrombin from its precursors and second the conversion of fibrinogen to fibrin under the influence of thrombin The precursors of thrombin are prothrombin calcium ions and a tissue element derived from the blood platelets or endothelial cells (thrombokinase cytozyme) Recent work has shown that trypsin and certain proteolytic snake venoms can replace the calcium and platelets and alone can activate prothrombin to thrombin In most of the theories of coagulation and they are numerous it is accepted that the prothrombin and calcium and thrombokinase unite chemically to form thrombin They and fibrinogen are all present in the circulating blood and one major difficulty in any theory of coagulation is to say why the blood remains fluid in the blood vessels It has been postulated that there is an antithrombic action of the plasma or that a protective substance is produced perhaps in the liver (heparin) In certain pathological conditions intravascular clotting may take place as a result of the agglutination of blood platelets at foci of irritation on the vessel walls More commonly there is extrusion of blood from the vessels into the tissues or to the exterior These conditions of increased bleeding may follow sepsis or be associated with jaundice with lack of vitamin C in anaphylactic states or may be idiopathic the last constituting the essential haemorrhagic states

The underlying pathological condition is by no means certain In some septic states there may be disorganized permeability of the capillary wall without alteration of the bleeding time the coagulation time or the precursors of blood clot in others these may be affected through changes in the bone marrow secondary to bacterial toxins or chemical poisons The importance of avitaminosis in scurvy is well known, and there are indications that a subscorbutic state may be present in many *patients owing to relative deficiency of vitamins* Recent work suggests that the bleeding tendency sometimes observed in jaundice may be due to deficiency of prothrombin while in states of anaphylaxis there is often a considerable increase in the antithrombic activity of the plasma In haemophilia in which the clotting time is delayed while the bleeding time is normal there is a delayed elaboration of thrombin apparently this is not the effect of a lack of thrombokinase but of an abnormal platelet stability or inhibition of thrombokinase production from the platelets Patients with thrombocytopenic purpura have a haemorrhagic tendency in spite of the fact that enough platelets are circulating to make the blood clot *in vitro* almost within normal time but the bleeding time is delayed and the clot formed retracts slowly

It will be seen that there are difficulties in expressing the underlying pathological states in this group of diseases and in opening the subject at the recent Annual Meeting of the British Medical Association at Belfast Professor L J Witts felt that more value would be obtained from the discussion if it were dealt with pragmatically His address is published in the *Journal* this week at page 689 In a critical discussion of modern advances of knowledge and of the recent literature of the subject Professor Witts is able to point out much valuable information that has accumulated particularly in regard to those haemorrhagic states which are secondary The great advance of the last decade in the haemorrhagic diseases has been the separation of scurvy as due to deficiency of vitamin C and the isolation and synthesis of vitamin C or ascorbic acid As is usual with any new and successful remedy it has been applied in the treatment of a number of diseases quite outside those of the haemorrhagic state Fortunately the

gruntled woman Perhaps the best method of deciding whether artificial termination of pregnancy would benefit a patient s health when the practitioner and consultant disagree would be for the doctor to take the opinion of a second independent specialist and abide by a majority vote —I am, etc,

STANLEY W WRIGHT, M B, M C O G

Newcastle, Staffs, Sept 29

SIR —I quite agree with Dr F M R Walshe's letter (*Journal* October 2, p 678) in which he states 'we may be thankful that in this country it [the Law] will never hand over to us the power of life and death over our future fellow-citizens' I have expressed similar views elsewhere, but feel that two types of case need consideration—namely, cases of rape and of incest Unpleasant as this subject is it must be faced, since these cases are more commonly followed by pregnancy than is generally realized Clearly in these cases it is against the interest of the State for pregnancy to continue and, in my view, with legal safeguards induction of abortion should be allowed —I am, etc,

London, W 1 Oct 3 JOHN H HANNAN

SIR —Dr F M R Walshe is surely wrong in holding that the nation would fetter itself with the chains of a potential medical tyranny if it allowed doctors to accede to any woman s request to have her pregnancy interrupted What is tyrannical is the present ruling that only seriously diseased women may legally have the operation It is a tyranny which a rapidly increasing number of women are determined to abolish, and which is openly deplored even by some Conservative Members of Parliament —I am etc,

London S W 15, Oct 2 B DUNLOP

Diagnosis of Ectopic Gestation

SIR,—The interesting paper by Dr W C W Nixon on aids in the diagnosis and treatment of ectopic gestation (*Journal*, September 18, p 579) recalls a method I adopted sometimes to confirm the diagnosis of ectopic gestation in doubtful cases As Dr Nixon says, acute tubal rupture with severe internal haemorrhage very seldom calls for any additional diagnostic measures The puncture of the posterior vaginal fornix is certainly, in the majority of cases, an appropriate means of confirming the diagnosis But because of the danger of infection or intestinal adhesions I should think it is not always safe unless immediately followed by laparotomy

The occurrence of shoulder pain is also a very useful sign, and the patient ought to be questioned about it, though in my experience most patients do not feel any such pain To induce this symptom by irritating the phrenic nerve I put the patient on the operating table in the Trendelenburg position, preferably under very light general anaesthesia If there was but a small extravasation in the pelvis some blood came in contact with the inferior surface of the diaphragm, and within a few minutes the patient started a regular singultus The hiccup stopped of course with deeper anaesthesia—for which chloroform was never used

In several cases in which I applied this test with a positive result the laparotomy showed an ectopic gestation with some extravasation into the pelvis and often only a trace of blood in the upper abdomen I have had no opportunity of trying the same test in cases of ascites in which I should think it would also be positive Whenever I find the peritoneal cavity containing free old blood I do not perform appendicectomy or any other operation on the gut, unless the need is urgent, because of the danger of infection of the peritoneum —I am, etc

London N W 6, Sept 25 H G LIEBMANN

Continuous Negative Pressure in Surgery

SIR —May I be allowed to compliment Mr M S Bennett-Jones on his well-thought-out paper on continuous negative pressure in surgery (*Journal* September 25 p 613) There are one or two statements, however to which he has committed himself I think unfortunately because while not really contributing to his argument, their accuracy is open to challenge If Mr Bennett Jones will consult my note on page 624 of the same issue he will see that the use of intercostal drainage by no means "entails the use of a small drainage tube The internal diameter of the cannula which I there describe is 10 mm

Then again, he says, "In narrow intercostal spaces the pressure of large drainage tubes *may* cause necrosis of adjacent ribs' One has also heard it said that necrosis of rib *may* occur after rib resection for empyema I suppose as a humble scientist I must admit that anything *may* happen but as a practical surgeon I do not consider that either statement need cause us any concern whether we believe in rib resection or intercostal stab Personally I believe in the latter as the first step at least in almost every case I am sure Mr Bennett-Jones is wrong when he says that 'it is better to resect a rib in all cases Even when he weakens so far as to say "in most if not in all cases' I think he is making a considerable over statement I could say much about the efficacy of the comparatively weak suction of the simple water seal method in drainage both of empyemata and of the chest after lobectomy, but I do not want to suggest that the stronger suction secured by Mr Bennett Jones is not an excellent thing too in more chronic cases it is admirable His presentation of the case for closed drainage of the chest could hardly be bettered —I am, etc

Liverpool, 1 Oct 1 JOHN T MORRISON

The Scope of Orthopaedic Surgery

SIR —I would like a ruling on a discussion as to the limits of orthopaedic surgery Do the following cases come under orthopaedic or general surgery? Gunshot wounds of arm all amputations' osteomyelitis, sarcoma of knee finger amputations, motor accidents to limbs, lacerations —I am, etc,

Grimsby Sept 23 S E DUFF

The Dangerous Area of the Face

SIR —In connexion with the annotation which appeared in the *Journal* of September 25 (p 629) may I point out that the venous or lymphatic anatomical peculiarities of the upper lip are not in themselves sufficient to explain the high mortality which attends complicated facial furuncles The lachrymal sac is much nearer to the cerebral veins and is often infected, yet the mortality is probably *nil*—at least I never saw or heard of a fatal issue To a lesser degree the same applies to hordeolum I remember seeing two fatal cases of thrombosis of the cavernous sinus following a hordeolum of the upper lid, but in view of the frequency of hordeolum the mortality must be nearly *nil* or at least very small indeed These are facts pointing to the solution of the problem The lachrymal sac is so situated that the action of the facial muscles in talking and eating does not affect it Only the orbicularis palpebrarum participates in the movement

only sixty six cases were admitted to the Port Health Authority's isolation hospital situated on the south bank of the river about a mile below the boarding station at Gravesend The boarding medical officers, of whom there is always one on duty night and day throughout the year, are comfortably accommodated on a hulk lying in the river at Gravesend and connected to the shore by telephone, so that wireless messages received from ships via the North Foreland radio station can be communicated promptly to the medical officers A sturdy ambulance launch with Diesel engines of some 200 horse power and capable of a speed of eleven knots, lies alongside the hulk ready to take the medical officer off to ships and to remove cases of sickness ashore. Strictly speaking the Authority is only responsible for the control of infectious disease, but because its officers are so readily available they are often called upon to give assistance to urgent cases of non infectious sickness and accidents

Quarantine is a thing of the past and the modern method is to facilitate, so far as possible, the movements of ships passengers and goods In this connexion an article in the current report on the surveillance of contacts shows the extreme care that is necessary in checking the destinations of passengers and members of crews who are contacts with such an infection as small-pox in order to secure that they shall be kept under the supervision of the medical officers of health of the districts to which they are proceeding The hygiene of crew accommodation in British ships has for many years engaged the attention of Port Sanitary Authorities who have made repeated representations to the Board of Trade as to the need for higher standards When the report was in course of preparation it became known that the Board of Trade was about to issue new instructions to its surveyors who are responsible for the supervision of the plans and construction of crew accommodation in new ships The medical officer of health therefore refrained from repeating former criticisms and awaited the revised instructions (which have now been issued), but he calls attention to the unsatisfactory arrangements for the feeding of crews of coasting vessels, which are often very hard run and in which the crew ration themselves and cook their own meals

The inspection of imported food is an important part of the work of the Port Health Authority Inspection must in the first instance be worked on a principle of sampling but experienced food inspectors know what is of established reputation what has been doubtful or unsatisfactory in the past and what is new and therefore to be carefully checked In this way control is much closer than would appear possible in view of the enormous quantity and variety of foods which enter the port During 1936 no less than 3,288 tons of foodstuffs were condemned as unfit for human consumption, and were either destroyed or disposed of for industrial purposes An article on the inspection of canned foods explains in detail the procedure by which an inspector—by the methods of inspection, palpation, percussion, and auscultation familiar to the physician—judges by external examination the soundness or otherwise of canned foods

Space will not permit of reference to other matters of interest in this report but it is worthy of mention that the medical officer of health, Dr Charles F White records the terms of a resolution in regard to shellfish which has been submitted to the Ministry of Health by both the Association of Port Sanitary Authorities of the British Isles and the British Medical Association The resolution is as follows

> That the present system of control of shellfish layings by closure is unsatisfactory as a public health measure and ruinous to the shellfish industry that it has now been proved that shellfish can be efficiently cleansed by relaying in the case of oysters and mussels and by steaming in the case of cockles and winkles that the necessary apparatus can be established and operated on a self supporting basis, and that, therefore the time has now arrived when legislation might be introduced with advantage to both the public health and shellfish industry requiring that only such shellfish (whether home produced or imported) as are certified by a responsible authority to have been cleansed in this country by an approved method in a recognized establishment should be sold for human consumption '

A NEW IDEA IN ASEPSIS

No surgeon escapes occasional disasters due to the infection of clean operation wounds This danger is all the more to be guarded against the greater the extent of the operation site and since advances in surgery often increase this an increase in the precautions taken to prevent such infection becomes ever more desirable Thoracic surgery now leads the way in exposing really extensive tracts of tissue to possible infection and thoracoplasty seems to have been the chief problem in asepsis which led Hart[1] to investigate the sources of accidental contamination and their possible prevention The wound infections which it was hoped to prevent were mainly due to *Staphylococcus aureus* and although these are commonly attributed to organisms previously present in the skin itself Hart denies this He found by exposing culture plates that the air of an operating theatre contained staphylococci in considerable numbers supposedly derived from the throats of the occupants since carriers as might be expected were often present and although their numbers could be diminished to a certain point by reducing the theatre personnel by excluding known carriers by masking and by alterations to the system

[1] *Arch Surg* Chicago 1937 34 874

commoner It is also curious that it did not get hung up in the journey down At the same time it had a very good chance of getting through, as there was nothing to "strike the barb in, and the point was probably not too sharp from rust—I am, etc,

London E C 2, Sept 27 E B Lathbury

"Qualification £3,000"

Sir—I feel that the following advertisement, which has appeared recently at least twice in the 'agony column of *The Times* is worthy of being kept on record in case the British Medical Association ever has to deal with another Osteopathy Bill, or with a Chiropractors Charter

PARTNER, Osteopath or Chiropractor either sex REQUIRED in a large established Ophthalmic practice Qualification £3 000—Write Box —— The Times E C 4

As no osteopath will admit that chiropraxis has any virtue, and the chiropractors are equally scornful about osteopathy it becomes apparent that to treat and cure eye diseases the one thing needful is—the needful!—I am, etc,

Woolton Hill, near Newbury, Oct 2 Henry Robinson

Obituary

J ALLMAN POWELL, M D

Physician and Anaesthetist Cheltenham General Hospital

We regret to announce the death on September 29 of Dr John Allman Powell, honorary physician and honorary senior anaesthetist to the Cheltenham General and Eye Hospitals, and consulting physician to the Tewkesbury Hospital He was born in 1884, eldest son of the late Dr B C Powell of Roscrae, Co Tipperary, and studied medicine at Trinity College, Dublin, where he had a brilliant academic career, graduating B A, B Ch, and B A O in 1907, and proceeding to the M D in 1910 After winning prizes in the University and holding a scholarship and resident posts at the Adelaide Hospital, Dublin, Dr Powell was appointed resident medical officer at the Wolverhampton General Hospital He began practice in Cheltenham in 1913, and the following year married Nora Kathleen, daughter of G N Oulton, K C He served three years with the R.A M C during the war In 1923 he was appointed as a physician to the Cheltenham General and Eye Hospitals In 1935 he was elected president of the Gloucestershire Branch of the British Medical Association, but shortly before he was due to take office he was stricken by a coronary thrombosis, and a second attack two years later ended his life Dr Powell knew no fear, nothing daunted him to the last moment of his life Within some months of his first attack he delivered his presidential address to the Branch it was characteristic of the man enforced rest was the one thing he was intolerant of He had a large practice, and his repute as a sound physician caused his opinion to be widely sought and much valued by his colleagues He threw himself into his hospital work with enthusiasm He made a special study of diabetes and designed a clinical chart for correlating the dosage of insulin with the rise and fall of sugar in the urine and the amount of calories in the diet Recently he had been doing valuable work in the use of the oxygen tent, and had demonstrated its use at meetings of the B M A at the hospital At the annual summer clinics given by the staff of the hospital his lectures were distinguished by common sense and clarity enlivened by a spontaneous wit that drove his views home to his audience For the same reason he was the most welcome of speakers at meetings of the local Branch of the B M A His remarks proved his wide reading, and yet were made with a modesty and puckish humour that were all his own The funeral took place at the Cheltenham Parish Church and though the memorial service had been notified as for personal friends and relatives, the church was filled and over forty of his profession were present

Dr J B Davey writes

The death of Dr Allman Powell has brought sorrow to hundreds of homes, rich and poor, in Gloucestershire In Allman, as he was affectionately known to his colleagues, were combined a wide knowledge of medicine with great resourcefulness He was at his best perhaps, in an emergency Then a decision was quickly reached and as promptly acted upon Until everything that could be done for the patient had been done he gave himself and anyone whom he had called in to assist no rest When to others all hope seemed to be lost Allman would stick to his patients, and at times seemed to compel them to recover by his infectious optimism A very skilful anaesthetist, he was in great demand by surgeons in difficult cases Intensely interested in his profession, he had the knack of rapidly extracting the important facts from a book or lengthy paper, and was ever eager to give his patients the benefit of any new and promising methods of treatment or diagnosis An enthusiastic supporter of the B M A he frequently contributed papers or in discussions at the meetings of the Gloucestershire Branch, and his election to its presidency about three years ago afforded him the liveliest satisfaction Unfortunately symptoms of the disease which ultimately proved fatal declared themselves shortly before he was due to assume office, and his activities as president were much curtailed in consequence The loss of an eye at hockey some years ago debarred him from ball games, but on a horse or in waders with a rod he could hold his own with most sportsmen Indeed it was a real delight to watch him cast a fly in an awkward position He enjoyed all that is good in life, but few things more than a day's fishing As companion on a holiday he was ideal A very charitable and generous nature complete absence of professional jealousy and a genuine desire to help colleagues in any difficulty endeared Allman Powell to practitioners all over the county He was a most lovable man

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

At a congregation of the Senate held on October 1 Professor H R Dean M D Master of Trinity Hall, was admitted to office as Vice-Chancellor In the course of his valedictory address the outgoing Vice Chancellor Mr G H A Wilson Master of Clare College mentioned the offer of a very large sum from the International Educational Board of the Rockefeller Foundation for new buildings and endowment for study of the biological sciences the bequest of £100 from the late Lady Allbutt for the Cambridge medical school library the signing of a contract for the new anatomy building and the approval given for establishment of new laboratories for research in clinical medicine

bosis Fat emboli which had been regarded as playing an important part in the production of petechial haemorrhages, were rarely seen Ring haemorrhages which were observed in cases where the patient had survived several days were interpreted as a late stage in the formation of petechiae active diapedesis having ceased and stasis having occurred in the vessel, the extravasated blood being forced into the tissues by an accumulation of tissue fluid in the perivascular space When petechiae are limited to the perivascular spaces they may be completely absorbed and perfect recovery from concussion may take place but if the haemorrhage goes beyond the perivascular spaces into the brain parenchyma degeneration of cells demyelination and subsequent gliosis will follow as in haemorrhage from a ruptured vessel and irreparable damage to the brain will result Finally it is stressed that these deep petechial haemorrhages are essentially associated with concussion and serve to differentiate it pathologically from contusion of the brain

"PARAGOITROUS" AFFECTIONS

A recent survey of the goitrous areas in Rumania by Dr Danielopolu, aided by some of his colleagues [1] has led to some interesting but disturbing results He is of opinion that for Rumania goitre perhaps even more than syphilis and pellagra is a factor making for racial degeneration His general classification of thyroid disorders need not detain us as it does not differ materially from that generally adopted in this country but the evidence he adduces of the existence of a group which he terms 'paragoitrous affections" occurring in goitrous areas calls for attention Under this term he includes arrest of growth idiocy, mental deficiency stammering and other disturbances of speech and of hearing sometimes amounting to deaf-mutism They may appear without the ordinary signs of hypothyroidism but their prevalence in the areas where goitre is endemic their association with goitre myxoedema and cretinism, mark them as of thyroid origin That bad conditions contribute to the thyroid disorder and these associated syndromes is demonstrated by the fact that in orphanages even in the districts where goitre is endemic only slight enlargements of the gland were seen good food and hygienic surroundings having raised the resistance of the inmates against the inroads of more serious mischief As might be anticipated the worst districts are mountainous where the diet chiefly consists of maize fermented apples and prunes—potatoes and haricot beans meat and eggs being rarely obtainable The dwellings were bad and ill lighted Hyperthyroidism on the other hand was met with only in the towns and usually among those living under favourable conditions of nutrition and hygiene His paper is illustrated by a number of striking photographs showing large goitres such as were formerly so much more prevalent in Switzerland and Derbyshire than they are to day But the most distressing illustrations are those depicting the familial incidence of the paragoitrous syndrome thus in one group both parents are goitrous and semi idiots two children are normal while four are deaf mute cretins In another the mother is goitrous and semi idiotic while all five children are deaf-mute cretins Maps of different districts indicate some communes in which nearly every house has some goitrous occupants not infrequently five or six His whole survey reveals an alarming state of affairs which could be greatly alleviated as it has been in other parts of the world but which if neglected must seriously imperil the nation

THE FORAMEN OF MAGENDIE

Since papers on the foramen of Magendie continue to appear we may well ask with Quintus the son of the old Titus Andronicus What subtle hole is this?" Ever since Magendie's original description in 1828 enterprising anatomists embryologists and surgeons have been wont to exclaim as did Saturninus "I'll see what hole is here" and investigate this region of the brain The latest contribution is from the pen of Professor J T Wilson [1] who in 1906 in what is now a classical paper on the anatomy of the calamus region of the human bulb threw light on the formation of the opening and its relations and now writes on its nature and mode of origin This foramen has for long given rise to controversy and as recently as 1930 Sir John Bland Sutton stated that there was no agreement among anatomists in regard to it [2] Sir John like Virchow Reichert, Kölliker Cleland and Mackay [3] and others looked upon it as an artefact produced by dissection and only quite recently we have heard a distinguished Continental anatomist deny its existence In 1923 Bland-Sutton wrote This foramen has had such charm for teachers that it maintains a place in textbooks although sealed up by practical anatomists many years ago [4] To this Professor Wood-Jones replied

As a teacher I fully admit the charm of this foramen and as a practical anatomist I also regard it with affection for of its presence in the undisturbed condition of the roof plate of the fourth ventricle I have no doubt whatever" [5] Nowadays neuro surgeons have frequently to examine the suboccipital region of the human brain and are in no doubt as to the normal presence of the opening Indeed in certain cases of non communicating hydrocephalus in which the roof of the fourth ventricle is closed over it is necessary to make an artificial foramen of Magendie in order to release the cerebrospinal fluid into the basal cisterns and subarachnoid spaces In 1930 as a result of observations made in both the operation theatre and the dissecting room attention was drawn to the undoubted presence and large size of the normal opening by Lambert Rogers and C M West [4] and though Professor Wilson in his recent paper disputes certain parts of the description given in their paper there can no longer be any doubt of the normal existence of a large opening in the roof of the fourth ventricle which constitutes the foramen of François Magendie

On September 30 the Lord Mayor of London announced at the Mansion House that Lord Nuffield had given £50 000 to the rebuilding fund for the Hospital for Sick Children Great Ormond Street Another gift by Lord Nuffield announced on the same day is £15 000 to the Princess Elizabeth Orthopaedic Hospital, Exeter, for the purpose of extensions and research

Lord Nuffield has placed £100 000 in the hands of trustees for the development of orthopaedic surgery, and an organized service for the early discovery and the cure of crippling disabilities in South Africa The scheme will be based on information to be gathered and collated by Professor G R Girdlestone, who will visit South Africa for the purpose during December and January

The October issue of the *Practitioner* is a special number devoted to advances in diagnosis and treatment, it includes twenty-one signed articles reviewing recent progress in general medicine, conservative surgery, biochemistry, and the specialties The price is 7s 6d

On September 30 the Lord Mayor of Birmingham launched an appeal for £49 000—the sum necessary to be raised before the Birmingham hospital centre scheme can be cleared of debt Sir Charles Hyde, proprietor of the *Birmingham Post* had lowered the debt to £49 000 by contributing £5 000

QUERIES AND ANSWERS

Pain in the Male Nipple

BALBUS writes I have under my care a minister—6 feet high and 8 stone—who though 82 years old is very active and can walk twenty miles with ease He complains that three months ago he felt a pain and uneasiness in both nipples of the mammae One recovered entirely, the other still remains in the same condition The chief symptom is a jagging pain and an uneasiness when anything such as clothing comes in contact There is no retraction or inflammation of the nipple It looks perfectly normal yet at its base there seems a little induration compared with the other Can any of your readers tell me if they have had any such experience in practice or refer me to any book in which one can find a description of the condition I have been thirty years in practice but have never seen it before I felt for the axillary gland but found no indication there I thought the trouble might have arisen from rheumatism as the patient has some other symptoms of that disease but perhaps I am wrong

Treatment of Enuresis

Dr A G BRINTON (Johannesburg) writes On several occasions this condition has been immediately relieved by correcting small errors of refraction The last case I had is typical of many A boy, aged 10, had + 0 5 astigmatism at 180° and this correction was ordered to be worn constantly A very grateful letter from his father arrived a month later This is comparable to many cases of mental disturbances hay fever sunstroke bilious attacks and many neuroses which are cured by fractional hypermetropic astigmatic corrections usually at bad angles round about the horizontal

LETTERS, NOTES, ETC

The "Times" Health Supplement

On Thursday September 30 the *Times* marked the inauguration of the Government's national health campaign by issuing a special supplement In this supplement articles from authorities on different aspects of national health reviewed the progress which has been made in the new preventive medicine Sir Farquhar Buzzard Regius Professor of Medicine in the University of Oxford contributed an article on the doctor in the home Sir Arthur MacNalty Chief Medical Officer to the Ministry of Health and Board of Education reviewed the British public health services while those for Scotland and Wales were dealt with by Dr J M Mackintosh Chief Medical Officer of the Department of Health for Scotland and Mr John Rowland Chairman of the Welsh Board of Health Sir George Newman contributed a study on the health of the school child and the subject of child guidance was considered by Dr A Macrae Dr N D Bardswell outlined the national scheme for the prevention of tuberculosis and an article on mental health was written by Sir Laurence Brock Sir Edward Mellanby the secretary of the Medical Research Council in a short article explained how the work of medical investigation is carried out in this country An article on the voluntary hospitals was written by Mr H L Eason Principal Officer of the University of London Other contributions to this symposium were by Dr J D King on the care of the teeth by Dr G F McCleary on safer motherhood and by Dr M D Mackenzie on recent trends in physical culture abroad together with articles by Dr Drummond Shiels on the work of the British Social Hygiene Council on port sanitation by Dr W M Frazer and on the work of the National Ophthalmic Treatment Board by Dr I Harvey Flack

Contamination of Postage Stamps

Dr A W PATERSON (Ipswich) writes Noting in your issue of October 2 a letter from Dr Holderness M O H Loughborough with regard to insanitary practices of shopkeepers I am stimulated to draw attention to a practice almost universal in post offices when supplying postage stamps The stamps whether singly or in sheets are invariably pushed across the counter with the gummed side downward and often flatly applied to the counter As it is a practice, convenient if far from sanitary to lick stamps before applying them to envelopes etc the likelihood of infection from a filthy counter is very great Considerable care should be taken to keep the stamps very clean and steps should be taken to instruct the public never to lick stamps under any circumstances I have not seen attention drawn to this source of infection before

Medical Golf

The autumn meeting of the Scottish Medical Golfing Society was held at Bramshot Golf Club Fleet on September 26 seventeen members being present A bogey competition was held in the morning with the following results (1) Dr A A M Reekie and Mr Hamilton Bailey—one up (2) Dr F M Loughnane and Dr MacMyn—all square The foursomes in the afternoon were won by Dr Bruce Williamson and Mr Hamilton Bailey—all square Dr Reekie and Mr Charles Donald Dr Shanks and Mr Gillespie tied for second place with one down

The eighth autumn meeting of the Sussex Medical and Dental Golfing Society was held on September 26 at Southdown in glorious weather The captain's prize presented by Mr Scott Page was won by A R Elliott with a score of 1 up The runner up was J H Twiston Davies The afternoon round was a four ball foursome against bogey which resulted in a tie with 3 up between W Gallaugher and W G Thwaites and O A C Warren and L Muir Smith

ANAESTHESIA IN GENERAL PRACTICE

This is one of a series of articles, contributed by invitation

PRE-OPERATIVE TREATMENT AND PREMEDICATION

BY

R MACHRAY, M B, B S

The present article outlines the measures that it is desirable to take in the preparation of a patient for operation in so far as these come under the control of the anaesthetist The extent of preparation necessary or possible will naturally vary widely, but the guiding principle should be that the patient comes to the theatre in the best possible condition of physical health and mental rest, so that he will the better be able to resist the disturbances that the disease, its operative treatment and the anaesthetic produce The period, therefore, between the decision to operate and the operation itself should be utilized with this in mind

General Rules

The length of time devoted to pre operative measures will vary with the urgency of the operation When circumstances allow it may be advisable for the patient to spend several weeks of easy life in pleasant surroundings with special attention to diet and sleep There will be cases in which, although the need for operation is urgent, a better result will be obtained if prolonged and complete rest in bed with appropriate medical treatment is enforced Such conditions may arise from the nature of the disease itself or from some intercurrent affection It is obviously wise to postpone until better weather operating on patients who are chesty every winter, and, in general extremes of temperature and fog should be avoided Dental sepsis has a definite influence on pulmonary complications It should therefore be eradicated if there is sufficient time for any possible reaction to subside otherwise much may be done with brushing and mouth washes These questions are usually outside the anaesthetist's province, but if the anaesthetist is also the general practitioner they will need consideration

Coming now to more immediate measures, adequate rest and opportunity for an unhurried preparation are essential, while the early morning say 8 to 9 o clock, is the best time for the operation itself These things can best be arranged for in most instances if the patient enters the nursing home early the previous evening after a good night s sleep he then has not to wait long for the final preparation before basal narcosis or the anaesthetic itself is begun In formidable operations and where lengthy preparation is necessary, and in the case of the old and feeble more time should be allowed and there should be a complete absence of hurrying Such a course will always be found worth while In comparatively trivial operations, however it is permissible for the patient to enter the nursing home only a few hours before the operation, if this takes place in the afternoon

Purgation

Where no action of the bowels will take place for two or three days as in abdominal operations it is obviously desirable that the alimentary canal should be reasonably empty and in other cases it will usually make the patient more comfortable But this emptying should be done by the most gentle method possible and vigorous purgation avoided Many of the drugs employed are mucosal irritants and not only will produce diarrhoea and a disturbed night but will increase the post operative discomfort and favour subsequent distension Another objection is that vigorous purgation will tend to dehydration and acidosis Frequently the patient will be able to say which aperient and what dose suit him best and also how long it takes to act the last is important, as an unbroken night must be assured and the bowels must be opened at least three hours before operation A suitable purgative is infusion of senna Sometimes the least disturbing results will be obtained from a combination of mild purgation and an enema An enema alone will be indicated in two circumstances first, when there is insufficient time for an aperient to act (although the patient can be instructed to take it at a suitable time before entering the nursing home), secondly, when avertin is to be given Here success depends so much on complete retention that unless several hours can elapse after the action from the purgative, it is unwise to risk an irritated bowel and better to rely on a skilfully administered soap and water enema Even this should be given four hours before the administration of avertin Pelvic operations need a more elaborate preparation, which is usually dictated by the surgeon

Value of Glucose

Where dehydration and starvation are present the loss should be made good by giving saline and glucose by the rectal route if necessary Pre-operative glucose is valuable in the prevention of post anaesthetic acidosis It should be prescribed especially when there is any evidence of deranged liver function and when previous anaesthetics have been followed by much vomiting In normal cases it probably has no effect, but since it also has no ill effect it should be given in all cases except the most trivial Recommended doses vary widely, but probably two to three ounces confer the maximum benefit and should be taken in lemonade with the evening meal Diabetic patients will need special treatment and a dosage of insulin and glucose worked out for each case

Sleep

A good night s sleep is of great importance and there will not be many patients who can manage this without assistance A sleepless night will not only cause great mental distress but will be wearing to the patient s physical condition Even if he has been sleeping well previously it is better to order a sedative The drug and dose will vary with the temperament but adequate dosage is essential Here again the patient may be able to suggest a drug that suits him or what is more important drugs that have no effect or are upsetting Aspirin and bromides are of help but not certain enough for routine use Nembutal grains 1½, is reliable, and may be combined with aspirin grains 10 Medinal grains 5 to 7½ is more powerful but does not suit everyone The patient should retire to bed before 10 p.m and immediately take the sedative and he should sleep until about 5 to 6 o clock If he wakes early and feels hungry he should be allowed a cup of tea and

of the sphincter mechanism at the lower end of the common bile duct, so that the bile may flow freely into the duodenum It is then unnecessary to feed the patient with bile By this method of gradual decompression the appetite of the patient improves rapidly, and "pancreatic asthenia" has not been observed during convalescence

278 Cirsoid Aneurysm

F W MARSHALL (*J R A M C* July, 1937, p 16) describes a new method of treatment for cirsoid aneurysm The tumour is not a true aneurysm, but has the distinctive pulsatile character and varix-like appearance of a localized dilatation of an artery Trauma is probably the most common cause of cirsoid aneurysm, and infection or operative incisions may also be causative, congenital telangiectases, vascular naevi or angiomata may be starting points The most common site is the scalp, although the lesion may occur in other places, such as the hand, foot, knee uterus or mesentery The tumour appears as a soft pulsating swelling which consists of tortuous and hypertrophied communicating vessels A continuous bruit is audible on auscultation, and a thrill is often felt on palpation, the tumour is compressible In cases of cirsoid aneurysm of the scalp the patient complains of a rushing noise in the head, with headache and giddiness If untreated the aneurysm may increase in size, cause atrophy of the skin and skull and may ultimately communicate with the cerebral arteries or rupture, and cause death from haemorrhage Treatment has hitherto been difficult and dangerous, but two cases are described in which a two-stage operation was carried out with complete success The first procedure was the tying together of as many of the nutrient vessels as could be found, with an injection of sodium morrhuate solution into the aneurysmal mass, subsequent injections being given if necessary The final stage consisted of the radical extirpation of the sclerosed mass This method of treatment is easy, free from danger, and its end-results are good

Therapeutics

279 Vitamin Therapy in Diseases of the Spinal Cord

R PFAFFENBERG and H MIELKE (*Klin Wschr*, June 26, 1937, p 919) do not believe in the common aetiology of subacute combined degeneration of the spinal cord and of pernicious anaemia The former, however, is often associated with diseases affecting the gastro-intestinal tract, such as pellagra, sprue, achlorhydric anaemia, etc In cases of affections of the spinal cord associated with anaemia the latter condition is often improved by liver therapy, while the spinal affection usually remains unaffected, although it benefits from vitamin B therapy The authors discuss the action of vitamin B Taken in the form of yeast given orally it often proved ineffective in cases in which its subsequent administration by injection gave satisfactory results, several standardized preparations are recommended The earlier the treatment was begun the better were the results, and no ill effects were observed from large doses The motor functions seemed to recover sooner and to a greater extent than did the sensory functions

280 Cod-liver Oil in Ulcerative Colitis

R SPIEGEL (*J Mt Sinai Hosp* N Y July–August, 1937, p 94), in a preliminary report, describes eleven cases of chronic ulcerative colitis which were treated by the rectal instillation of cod-liver oil emulsion by means of a Murphy drip or a partly clamped enema bag with satisfactory results For the most part a 40 per cent emulsion of cod-liver oil acacia and water was used In patients whose lesions had healed, leaving only a slight residual ulceration in the anal part of the rectum, suppositories containing 68 per cent cod-liver oil were given The treatment began with the administration of 2 to 4 ounces of the emulsion two to four times a day, the dose being gradually increased until 8 ounces could be retained The duration of the disease was from ten months to nine years, and in all cases other forms of treatment had been ineffective The progress of the cases was observed sigmoidoscopically, and nine of the eleven patients improved At the end of the third month of treatment the sigmoid appeared normal except for very fine granulations, and abdominal cramps and rectal urgency had diminished or were absent In the later part of the treatment instillations were given less often

281 Magnesium Oleate as a Cholagogue

F GRADINGER (*Med Welt* July 31, 1937, p 1072) has investigated the cholagogue action of magnesium oleate In ten patients a duodenal tube was passed and the duodenal secretion tested at ten minute intervals After one hour 5 grammes of magnesium oleate were injected into the tube and the duodenal secretion again tested In the majority of cases a marked increase of bile in the secretion was noted No effect on the excretion of bile was noted in severe cases of jaundice, but in diseases of the gall bladder and of its ducts magnesium oleate appeared to have a beneficial action In cases of enlarged liver due to heart failure long-continued treatment with magnesium oleate resulted in a retrogression in size of the liver, even to normal dimensions in some instances

Radiology

282 Radium Treatment of Prostatic Adenomata

R BOUCHARD (*J Urol med Chir* June, 1937, p 522) describes a case of adenoma of the prostate which occurred in a man of 78 and which was treated by two applications of 55 milligrammes of radium element with an interval of seven weeks between the two applications Improvement was seen almost immediately, and at the end of seven years the patient was in excellent health, without any difficulty in micturition, the prostate was almost normal in size, and a slight difficulty in passing a catheter was removed by dilatation It is suggested that this method of treatment might be used more extensively in those cases of adenoma of the prostate which are not suitable for surgical intervention The immediate benefits are certain, and there is no danger of shock, haemorrhage, or infection, and the mortality is *nil* In cases in which enucleation is not possible resection under local anaesthesia is recommended for the treatment of the median lobe, and radium for the large lateral lobes Reference is made to other cases which have been successfully treated by the application of radium

283 Cancer of the Lip

S A HEYERDAHL and R B ENGELSTAD (*Tidsskr norske Laegeforen* July 1, 1937, p 692) report from the Norwegian Radium Hospital in Oslo their experiences of the treatment of cancer of the lip in 1932 and 1933 Of their forty-nine patients only two were women In as many as forty-seven cases the lower lip was involved, the upper lip being the seat of the primary lesion in only two cases After an interval of two and a half to four years thirty were symptom-free and there were also four patients who at the time of their deaths from intercurrent diseases, had been symptom-free for from one to three years after treatment All the twenty-one patients in whom the cancer was operable and who had no enlarged glands were symptom-free on re examination In a second group in which the disease was still operable although enlarged

ness is not always lost, although there will be no recollection of this

Avertin is the most reliable in its hypnotic action Its dosage (0 1 gramme per kilogramme of body weight) and method of preparation can be obtained from a table supplied by the makers and should be adhered to Obese and elderly patients require a smaller dose—say three quarters—while the maximum should be 8 grammes In cases of doubt it is best to run in three quarters of the selected dose and after a quarter of an hour to use the remainder if consciousness has not been lost It should be given half an hour before operation and the patient be kept on the side until the anaesthetic is started This will minimize the risk of obstruction as the jaw relaxes

THE SHANGHAI BOMBARDMENTS

Any scepticism that may have been felt regarding newspaper reports on the effects of Japanese bombing of densely populated Chinese cities is dispersed by first-hand accounts of the experiences of resident British doctors which are now reaching England The plight of the unfortunate Chinese civilians and the immense difficulties of providing adequate medical aid for the stricken and homeless are now more fully realized in this country and on the Continent The League of Nations has voted a sum of £250 000 for medical services in China Following an appeal by the Archbishop of Canterbury and other leading men a national fund has been opened for the relief of distress under the auspices of the China Association the British Red Cross Society, and the Conference of British Missionary Societies Meanwhile, pending the arrival of reinforcements of medical personnel and supplies the energies and resources of doctors and hospitals in Shanghai Canton and other Chinese cities are sorely strained

Care of Wounded Civilians

In the Shanghai bombardments the task of dealing with the wounded civilians fell largely to the Lester Chinese Hospital This institution, founded in 1844, is staffed by missionary doctors and nurses appointed by the London Missionary Society and also by Chinese members of both professions There are normally 230 beds and 4 000 in patients are treated annually while the number of new out-patients reaches 62,000 Since other hospitals had to be evacuated for military reasons while the emergency and Red Cross hospitals were entirely reserved for the soldiery the influx of wounded civilians into the Lester Hospital was particularly heavy Some measure of relief was afforded by the conversion to a temporary hospital of the Lester Institute normally devoted to laboratory work and research In addition to the great number of direct victims of the bombardments many of whom suffered from severe cranial or abdominal wounds other unfortunates were brought to hospital, especially Koreans who suspected of being Japanese spies had been severely handled by the crowd The appalling effects of modern explosives in densely populated areas are evidenced by the statement that the bursting of one single shell resulted in the death of two hundred people

Among casualties brought to the Lester Hospital was a man whose body completely severed across the middle was still held together by his almost uninjured clothes In another case a Chinese mother was blown to pieces while the twin babies in her arms escaped with a few scratches Less tragic but grimly humorous was the case of a woman whose leg had to be amputated On regaining consciousness she burst into tears bemoaning the loss of thirty dollars which had been hidden in the stocking of the severed limb

Apart from the great influx of major surgical cases many other factors increased the difficulties of the hospital The staff was depleted by the holiday season As a precaution against fires the gas supply had to be cut off The general disorganization consequent upon the bombardment made it difficult to obtain food and other supplies while a plague of flies from the corpse littered destroyed areas caused a heavy incidence of dysentery

These accounts of the troubles encountered in Shanghai in dealing with civilian victims of artillery, and especially aerial bombardments give a painful foretaste of the conditions which may be expected in our own cities in the event of another European conflagration Similar problems will have to be met and it is important that measures for dealing with the civilian victims of aerial warfare should be perfected as far as possible, in peace time This point has been stressed in our correspondence columns

In the issue of October 2 we printed a letter received by the Secretary of the British Medical Association from Dr R C Robertson of the Lester Institute Shanghai The letter quoted a cablegram from the British doctors of that city appealing to the B M A to exert its influence to prevent the carnage caused by bombing

CONGRESS FOR EXPERIMENTAL CYTOLOGY ZURICH, AUGUST, 1938

According to the decisions taken at the fourth Congress in Copenhagen the fifth International Congress for Experimental Cytology will be held in Zurich Switzerland during the week August 7 to 12 1938 The sixteenth International Physiological Congress and the International Veterinarian Congress will be held in Zurich too on August 14 to 18 and August 21 to 25 respectively

The proceedings of the Cytological Congress are not to be divided in sections but will be organized in the following way scientific sessions will take up seven half-days two afternoons are reserved for demonstrations and during one afternoon there will be an excursion Special subjects are to be treated at each session opening with a general review to which one or two supplementary reviews may be added Reprints of these papers will be sent to the members of the Congress at their home address or—if very late—will be handed over to the members at the opening sessions Copies of the individual papers are likewise to be distributed before the sessions, the main object of the Congress being the discussion of cytological topics of special interest.

In agreement with the International Committee the Local Committee has chosen the following subjects for review epithelium in culture and in the organism structure of chromosomes mechanism of mitosis cancer cells and normal cells experimental research on cytology and viruses ultrastructure of the protoplasm and its products chemistry of the cell These reviews are calculated to cover the seven scientific sessions in the order indicated above The names of the reviewers will be published in the second preliminary programme The individual papers must be registered at the Congress Bureau before April 15 accompanied by a summary not to exceed half a page in the *Archiv f exp Zellforschg* (the address of the Congress Bureau is Prof W von Möllendorf 9 Plattenstrasse Zurich) The Local Committee will decide in each case whether it is possible to accept papers entered later than April 15

Further information about the Congress may be had through Professor W von Möllendorf or the honorary secretary for the Society Harald Okkels M D., Institute for Pathological Anatomy University of Copenhagen Denmark

The Board of Control (Metropole Buildings Northumberland Avenue W C 2) has issued a revised list of medical practitioners in England and Wales who have been approved by the Board for the purpose of making recommendations under Sections 1 (3) and 5 (3) of the Mental Treatment Act 1930 The names are given first in alphabetical order with full addresses, and are then regrouped geographically

Obstetrics and Gynaecology

290 Ultra-violet Irradiation in Pruritus

M Segre (*Minerva med* July 22, 1937, p 65) in pruritus not due to systemic disease finds ultra-violet ray therapy much more rapidly effective and less dangerous than other methods of treatment, in particular he thinks it superior to x-ray therapy He uses a quartz lamp and mercury vapour, and varies the dosage considerably according to the cutaneous sensibility previously determined by trial He finds that the response is usually more acute in pale or blonde persons and as age advances A very fine desquamation rather than erythema and scaling is aimed at He prefers well spaced applications, the reaction from the first having disappeared before the second is made, and attaches importance to equal irradiation over the whole area of application, supplementary treatment being given to folds or cavities While encouraging the use of cold water compresses, he forbids the employment of ointments during treatment, although the use of soap and water, provided that the former is not too alkalined, is not forbidden, and diet is in no way modified The success of the treatment is due to its analgesic, vasodilator, and antibacterial actions and is bound up with its stimulation of cutaneous pigmentation Segre has had specially good results in senile pruritus, in pruritus of the anal and genital regions, and in that recurring in spring and summer

291 Puerperal Polyphlebitis

A P Ramos and P P de Biondini (*Ann bras Gynec* July, 1937, p 1) record the case of a woman aged 19 who a few days after Caesarean section developed loss of power in the right lower limb owing to the presence of femoral thrombosis Three days later a similar process occurred in the other leg, both arms, and the left side of the face, and was accompanied by high fever The patient was left immobilized, with the result that in eighteen days the temperature had subsided, in another twelve days the affected parts could be moved, and the patient was discharged in good health on the fiftieth day Similar cases which are very rare, have been described by Laennec (1828) Bouchut (1844), Jeannin (1905), and Commandeur and Bonnet (1909)

292 Colposcopy

H Henselmann (*Munch med Wschr* July 9, 1937, p 1082) points out that colposcopic examination, of which he has had three and a half years' experience, aids in the diagnosis of cancer to an unprecedented extent because of its magnification of 10 5 and its excellent illumination In 1,133 women sixteen cases of very early malignant infiltration were discovered in which it was seen that the malignant cells appeared first in the normal mucous membrane The author divided his cases of carcinoma of the cervix into three classes (1) cases which were easily diagnosed, (2) those which were diagnosed with difficulty and only by biopsy or by the occurrence of symptoms and (3) very early cases in which minute ulcers were present Colposcopic examination was of little additional value in the first group, it aided the differential diagnosis in the second and in the third it is the only diagnostic method possible The colposcope can be used to discover the early stages of carcinoma of the cervical canal, and the author has even been able to diagnose carcinoma of the body of the uterus, the presence of which was suspected by the occurrence of a brown or haemorrhagic secretion from the upper parts of the uterus He excluded from this series cases of manifest carcinoma or those suffering from other diseases Only sixty-eight of his cases came with no symptoms but only a desire to ascertain whether or no a carcinoma of the cervix was present All patients were expressly requested to return if any new symptoms should occur lest negative findings should produce a sense of false security By his rigid exclusion of all irrelevant cases Henselmann hopes to gather clinical material sufficiently large to warrant new discoveries in the diagnosis of early uterine cancer Of 278 women in whom carcinoma was discovered within three months of the onset of symptoms only 32 per cent could be cured With the colposcope the author is convinced that he will be able to raise this proportion of cures by diagnosing cases months or years before the onset of symptoms

Pathology

293 Vitamin A Excretion

R Boller O Brunner, and E Brodaty (*Wien Arch inn Med* July 31, 1937, p 1) have investigated the excretion of vitamin A in 321 patients before and after the administration by injection of this vitamin in the form of 'vogan The cases investigated included malignant tumours of the lungs, liver, and kidneys The reaction in the urine was the same before and after the injection of the vitamin Parenteral administration of the vitamin is therefore necessary only when the patients are unable to take nourishment, or in the presence of gastro intestinal disturbances sufficient to diminish absorption of the vitamin from the alimentary tract Vitamin A was found regularly in the urine in cases of jaundice with complete obstruction of the biliary ducts, in cases of chronic nephritis and nephrosis, and lastly in lobar pneumonia before resolution In severe cases of cirrhosis of the liver the reaction in the urine was also always positive, but it was impossible to find a definite connexion between the severity of the affection and the elimination of the vitamin The authors discuss the possible explanations of the excretion of the vitamin Pyramidon decreases its excretion, and in cases in which the secretion is already reduced pyramidon may stop it altogether

294 Type Studies of Pneumococci

N I Nissen (*Ugeskr Laeg* July 29, 1937, p 801) reports from a Danish hospital and from the State Serum Institute in Copenhagen his observations on 362 samples of sputum from patients suffering from bronchopneumonia Pneumococci were found in 192 of these cases and were classified according to type In the course of his investigations, which were extended to samples not only of sputum but also of pus, cerebrospinal fluid, blood, etc, sent to the State Serum Institute from different parts of Denmark, the author has isolated 300 strains from as many different persons, and, as one of his tables shows, nearly all of them could be brought into line with the classification of types of pneumococci described by Cooper Only in 3 7 per cent did the author fail to identify a culture with some type already known In the order of their frequency the pneumococci were identified with Types I, VII, III, VI, IV, and VIII More than 50 per cent. of all the types identified belonged to Types I, VII, and III In eighty-three cases of croupous pneumonia with typically rusty sputum Types I, VII, IV, and III were most often found, Type I being present in thirty-nine cases and Type VII in thirteen Only in one case did the type of pneumococcus change in the course of an infection, and then only after an interval of a month from recovery from pneumonia Successive bacteriological examinations in different stages of pneumonia showed that the type of pneumococcus identified rapidly diminished quantitatively in the sputum and usually disappeared completely in the course of two to six weeks But at the onset of the disease it was most exceptional not to be able to find and identify the pneumococcus responsible

Cancer Campaign for their continued generous support of the school's research work Last year the Medical Research Council in addition to the material support and facilities it afforded had given the school four full time research workers in the Courtauld Institute Reference was made by Dr Boldero to the new Rudyard Kipling Fund to assist students or recently qualified men who might otherwise have to abandon their careers and to the latest gift of Mr Meyerstein, an athletic ground at Chislehurst costing £14 000 and covering 18½ acres For the first time the school possessed a ground entirely its own Inasmuch as the rebuilding of the hospital was complete, those responsible for the school considered themselves at liberty to mention their own needs The Bland Sutton Institute of Pathology and the Courtauld Institute of Biochemistry provided excellent and up to date facilities for final year students But the fundamental subjects—those of the first and second M B—must be improved and with that object a complete scheme had been evolved of which the Board had approved and to which the University of London sympathizing with the need had contributed That scheme envisaged rebuilding in three stages The toast to the guests was proposed by Mr ERIC PEARCE GOULD and responded to by Surgeon Vice-Admiral P T NICHOLLS Medical Director-General R N Finally a toast to the Chairman was proposed by Dr D EVAN BEDFORD who acknowledged the enthusiasm and encouragement of Dr McAlpine in connexion with the neurological work now bearing fruit in the hospital For reasons of age Professor T Yeates is to retire in the near future and this fact gave rise to the many tributes paid to him during the course of the evening

WESTMINSTER HOSPITAL DINNER

The annual dinner of the old students of the Westminster Hospital Medical School was held at the Park Lane Hotel on Saturday October 2 In proposing the toast of The Westminster Hospital and Medical School the chairman, Mr A F MacCallan, referred to the new hospital and medical school which are at present being erected on adjoining sites in Horseferry Road The new school buildings would be ready for occupation, he said in January of next year and the new hospital which would have 350 teaching beds, a year later In the new school special provision had been made for the entertainment as well as for the teaching of students He concluded by congratulating Dr Arnold Stott upon his appointment this year as Physician to His Majesty's Household Major-General J W L Scott in replying to the toast which the chairman had proposed said that though the material conditions in which the work of the Westminster Hospital was carried on were going to be changed the spirit of the institution was unchangeable He believed that this indefinable spirit could justly be regarded as the result of a constant and happy communion between the staff and students of the hospital Mr J H B Round the secretary of the Students Clubs Union also replied and gave some account of student activities during the past year The toast of The Visitors was then proposed by Dr Adolphe Abrahams, the Dean of the Medical School In an amusing speech Dr Abrahams welcomed particularly Sir John Parsons the President of the Royal Society of Medicine Mr L H Savin of King's College Hospital and the Rev the Master of Charterhouse who had twice been Mayor of Westminster On behalf of the many distinguished guests the Master of Charterhouse then replied to this toast and told some anecdotes about his many medical ancestors The Chairman was proposed by Dr Arnold Stott who made witty reference to the many distinctions which had fallen to the lot of Mr MacCallan after his twenty years of ophthalmic work in Egypt To this toast the chairman responded briefly and at the same time conveyed the thanks of a large gathering o the secretaries of the dinner

UNIVERSITY COLLEGE HOSPITAL

The opening of the winter session 1937-8 at University College Hospital Medical School was marked by a reception given by the Dean and members of committee in the library on the afternoon of Tuesday October 5 All the hospital school, hostel buildings and paying patients wing were open for inspection

The following special demonstrations were on view In the bacteriological theatre, on the second floor of the Medical School the Curator of the Museum had selected a number of specimens and set out some microscopical slides and the director of the Radiological Department had arranged a demonstration in the new x ray department Dr Nina Kellgren showed a new cinematograph film on The Physical Development of Children and Corrective Exercises for Postural Abnormalities in No 1 Lecture Theatre The film illustrates postural abnormalities in young children ranging from 3 months to 8 years and how most of them can be remedied in the home by corrective exercises Dr Nina Kellgren who has spent over two years of intensive work on its production shows by comparison with a normal healthy child the abnormalities which occur at varying ages One of the most difficult ages is at 5 years actually over one hundred children of that age were examined to find a normal child suitable for the purpose of the film The primary object of the film is the education of students but its value to mothers throughout the country, if funds were available for its distribution, would be enormous in that the first part educates mothers what to look for in children, and the second part illustrates the corrective exercises for abnormalities depicted in the first part

ST. BARTHOLOMEW'S HOSPITAL

OLD STUDENTS' DINNER

The St Bartholomew's Hospital Old Students Dinner was held on October 1 in the College Hall, Charterhouse Square, Dr C M HINDS HOWELL, who recently retired from the position of senior physician to the hospital, being in the chair

In the unavoidable absence of Mr Justice Luxmore Mr G E H PALMER, Member of Parliament for Winchester and nephew of the chairman, filled the gap at the last moment and ably proposed the toast 'The Medical College of St Bartholomew's Hospital' He said that the difference between doctors and politicians was that doctors got credit for curing disease and abolishing evils, while the politician was blamed for causing all the evils in the world They had however many difficulties in common such as dealing with people who thought there was something wrong with them when in fact they were quite all right and with people who thought they were quite all right when they were quite all wrong Referring to the history of recent times, Mr Palmer asked why it was that man behaved as he did The politician was unable to supply an answer, but perhaps the medical profession could It was he considered, an important question and he hoped that everyone would turn to science biology and medicine in order to find a solution to the problem

In response Dr HINDS HOWELL in the manner which has endeared him to generations of Bart's students, gave an account of the activities of the hospital and the college during the past year The Duke of Gloucester, he said had consented to take office as president of the hospital, and he reminded them that the Duke of Windsor as Prince of Wales had attended the first dinner to be held in the college hall two years ago This year Queen Mary had opened the new medical block which had been in active occupation for the past two months The hospital

for RELIABILITY

"CERABAN" ADHESIVE SELF-SUPPORTING BANDAGE

The Supplementary or Alternative Treatment to Self-Adhesive Elastic Bandages for

SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, ETC

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN," whilst free from rubber possesses elastic properties and when carefully applied to the limb gives substantial support It is porous adhesive and non irritating will not chafe and permits of complete respiration of the skin

In the treatment of Varicose Ulcers the use of Ceraban Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages In the less severe of such cases a distinguished authority writing in the *Lancet, page 580, Sept 7th, 1935, issue* recommends the use of Ceraban Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by Ceraban It is waterproof antiseptic and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip

that responsibility may become an intolerable burden, the young people who are just starting in life and to whom bad or good health means weariness and pain or that sense of power which is in itself an active enjoyment, and the small children who are at that critical stage when neglect of some simple precaution or some mistake in diet may handicap them all the rest of their lives

Existing Health Services

We are fortunate in this country in that all parties in the State have in the past used their opportunities to develop a range of services and facilities for improving the health of the people which has not been surpassed by any country in the world What we have not yet succeeded in doing is to ensure that those services are used to the full

Local authorities know well the difficulty of persuading people to take full advantage of their health services They have made great and praiseworthy efforts to spread the knowledge of what they are doing, and they have been backed up by numerous voluntary bodies with all that enthusiasm which is so characteristic of voluntary service But we believe that something more is called for at this time, something in the nature of a national campaign with all the publicity that can only be achieved by a concerted and organized attack by Government, local authorities voluntary organizations, doctors teachers and Press all working together for the same end

The Sanitary Cordon

Our health services are of two kinds those which come to the individual without any effort on his part, and those which require his active personal co operation

In the first category come such services as drainage, refuse disposal, street cleansing, and the provision of a pure water supply It is to these services that we owe our relative immunity from dangerous diseases that formerly used from time to time to sweep the country In 1866, for instance there was an epidemic of cholera 14 000 people died of it in England and in the squalid streets of the poorer parts of London the mortality was frightful To-day thanks to the improvement in these health services, cholera is unknown though the individual takes no special precautions to protect himself and thinks no more of the quality of the water he drinks than of the air he breathes

Personal Health Services

But there is another and more personal kind of health service which involves the necessity on the part of the individual man or woman to "do something" in order to take advantage of it In this category of personal service I give naturally a foremost place to that old-established and trusted institution the family doctor A cardinal rule of health is, Ask your doctor and, above all, Ask him in time Nor must I forget the great voluntary hospitals, with their relatively new allies, the municipal hospitals

Of this kind are our ante natal clinics and infant welfare centres our tuberculosis dispensaries and our facilities for the treatment of venereal diseases our school medical and dental services and our milk in schools scheme Some of these services have been in operation a long time others are of a more recent date and we are still adding every year to the weapons we use against ill health Under the stimulus of the Local Government Act of 1929 there has been a great extension of public general hospitals based on wider areas and separated from association with the Poor Law Even within the past few months we have had the Midwives Act of 1936 under which local authorities are making arrangements for properly qualified midwives on a whole time salary basis to be available for attendance either as midwives or as maternity nurses on women in their own homes These new developments will make their influence felt increasingly as time goes on, but we have only to look at the vital statistics to see that already the most encouraging and indeed startling results have been achieved In the last fifty years the standardized death rate has been brought down from 18 7 to 9.2 per thousand the infant mortality rate from 138 to 59, and the mortality rate from tuberculosis from 2 450 to 657 per million And the expectation of life of a newborn child to day is nineteen years longer than it was when I was born

Inertia and Procrastination

If we have achieved this success with services which only benefit a part of the population because the other part are not using them, may we not hope for still greater improvements if only we can overcome the inertia or the obstacles that keep them away What are these obstacles? It may be that the mother is too shy to go to the ante natal clinic Maybe she does not realize that the child s teeth are decaying and poisoning his system It may be that the person who has a tiresome cough is afraid to consult the doctor lest he or she should be told that they have been attacked by tuberculosis It may be that the child does not like milk or that the mother thinks that because it is cheap it is also nasty Whatever the cause, unfortunately we have plenty of evidence that in many places these health services are still not appreciated as they should be Let me give one or two instances to illustrate what I have just said

When I first began to take an active interest in public health tuberculosis was regarded as the most terrible and fatal of all the more familiar diseases But thanks largely to the vigorous measures taken to control it which have now been in operation for many years the death rate from tuberculosis in 1936 was less than half what it was on the average of the first ten years of the century, and to-day we can say that tuberculosis is an eminently curable disease provided it is diagnosed and dealt with at an early stage But although tuberculosis is now a compulsory notifiable disease we still find that a large number of cases are only brought to the notice of the M O H in the later stages when it is too late to effect a cure and sometimes even not until death has taken place The patient may for instance have ignored early symptoms and put off a visit to the doctor till the disease has become well established

Then again the figures of children under 1 year who attend infant welfare centres vary enormously In some areas the whole of the infant population attends in others the attendance is as low as 10 per cent Exactly the same variation is found among expectant mothers receiving ante natal care

Another striking instance of the disregard of health services is to be seen in the milk in schools scheme under which children can buy a 1/3 pint bottle of milk for 1/2d—that is at half the ordinary retail price School medical officers and teachers all over the country have testified to the good effects of the milk in improving the physique and the mental alertness of the children who take it regularly And yet if we leave out the children who receive free milk in these schools less than half the remainder are buying milk at the reduced price.

A Campaign of Publicity

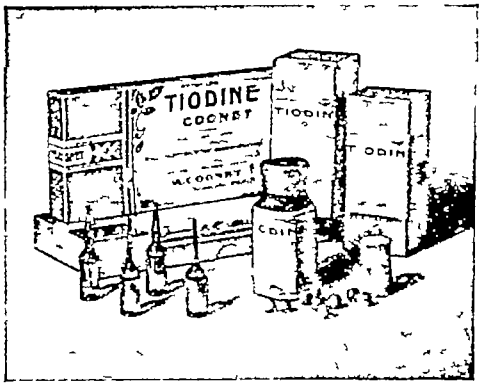
Now these illustrations and I could give others to supplement them show clearly how great a need there is for a concentrated and determined crusade against ignorance, carelessness and indifference about health services We have got to bring home to everyone what are the dangers of ill health and how they may be avoided, and that whether it be for themselves or their children it is their duty not to neglect the services which are at their disposal

It is then with this object that the Government and the Central Council for Health Education have determined to carry on during the next six months an intensive campaign of publicity and propaganda, in co-operation with

"MIST. PEPSINÆ CO. c. BISMUTHO"

(HEWLETT'S)

OVER 60 YEARS' REPUTATION



COMPOSITION —Pepsin, Bismuth, Sol Opii Purif., Hydrocyanic Acid (P.B.), Tinct. Nux Vomica, &c.
An elegant preparation, miscible with water, invaluable in Gastric Catarrh, Pyrosis, Carcinoma and all forms of Atonic and Irritative Dyspepsia

DOSE HALF TO ONE FLUID DRACHM DILUTED

Packed for dispensing only, in 5, 10, 22, 40, and 90-oz. Bottles
This preparation is also supplied "sine Opio," the dose and price remaining the same

WORLD SURVEY ON NUTRITION

[FROM A CORRESPONDENT IN GENEVA]

Nutrition as a subject of international concern first took the stage at the League of Nations Assembly two years ago At the Assembly now ending in Geneva it again held a position of prominence delegates from more than half the countries in the League taking part in discussions which occupied three sessions The whole question was raised originally at the instance of the Australian delegate Mr Stanley Bruce and both the committees concerned with it, one considering its economic and social aspects and the other its physiological aspects had British chairmen—namely, Lord Astor and Sir Edward Mellanby

British Empire

Lord Astor himself opened the discussion in the present Assembly by summarizing the final report of his Mixed Committee so called because it represented consumers and producers economists and agriculturists, and medical and social experts He said that something like thirty national nutrition councils had now been set up The representatives of a number of these had recently met in conference, and he had been particularly impressed by the value of the interchange of experience which had taken place regarding the technique of nutritional surveys in different countries and methods of nutritional education and propaganda

The discussion was continued by Mr R H Bernays M P Parliamentary Under-Secretary to the Ministry of Health who described the steps which Great Britain had taken to deal with malnutrition in colonial areas Reports showed the Colonial Governments to be fully aware of the urgency of the problem These reports contained accounts of surveys schemes for distributing milk for school children research work propaganda campaigns and courses in schools they were at present being studied by a central committee presided over by Lord De La Warr Mr Bernays also mentioned the adaptation of agriculture to the requirements of improved nutrition There had been a striking change in this direction, he said in the agricultural output of the United Kingdom—a sharp decrease in the area under cereals and a rise in the number of dairy cows Cereals at present represented only 5 3 per cent of agricultural output non-protective foods (excluding potatoes) only 11 4 per cent, protective foods (dairy produce eggs fruit and vegetables) 45 per cent, and intermediate products (potatoes meat and poultry) some 40 per cent Some account was also given by the Australian delegate of the movement there where an Advisory Committee on nutrition had already presented three interim reports In spite of the comparatively high level of nutrition in Australia there was much scope for further improvement and in particular the consumption of milk was too low The South African delegate said that in the Union attention was being concentrated on the nutrition of children Rations of cheese and milk were given in all primary schools and to some children in secondary schools

Nutrition in Europe

The speeches by the various delegates from European countries suggested that nutrition is not being lost sight of in military preparations In Hungary for example the minimum and also the optimum dietary requirements of agricultural workers are being studied, as well as the *problem of the adjustment of agricultural output to* nutritional needs The Austrian delegate called for the establishment of a uniform international classification by nutritive values of food destined for export, but Lord Astor said that the question of the classification and standardization of foodstuffs was already being studied by a technical committee appointed at the recent conference of representatives of national nutrition committees The Polish delegate complained that the nutrition problem of the peasant had been neglected, to which Lord Astor replied that this was mainly due to the scarcity of information on the subject Sweden called for a special international conference to investigate further means of stimulating the consumption of such important foods as milk and dairy products Denmark praised the moderate commercial policy of the United Kingdom in respect of tariffs which had enabled the British people to enjoy food at less than half the prices paid by many other European communities Finland described its progressive nutrition policy including important measures for improving the nutrition of school children and young persons studies of the diets of income and occupational groups, and investigations into agricultural productivity

South America

The delegates of Central and South American States also contributed their experience Venezuela had reduced *taxes on foodstuffs established health centres for children* encouraged diversity of crops introduced price control and distributed milk to the necessitous Uruguay had set up a large committee on popular nutrition, with sub committees in all the provinces under the auspices of the Ministry of Public Health and Public Welfare and an attempt was being made to provide fish foods and tropical fruits at economic prices and to reduce transport and distribution costs Chile had set up a national food council consisting of the Ministers of Agriculture Health and Labour, with various technical specialists A subsistence commissariat had been established to ensure a supply of staple foods direct from producers to consumers at costs reduced by the elimination of middle men Free midday meals were provided for all children in elementary schools the production and distribution of milk was being centralized and organized as a social service, and working mothers received benefits equal to half wages during the whole period of lactation Mexico spoke of a control established over the quality and price of protective foods, popular education in the principles of dietetics courses in scientific nutrition in its medical schools, teachers colleges and nurses training homes and publications on peasant nutrition and standard diets for workers

Asia and the Far East

In Asia too the gospel of nutrition is being vigorously spread The Indian delegate pointed out that the standards of nutrition employed in the League's inquiries had so far been based upon conditions in Europe and North America and for the East different standards would be required The Indian Government, he said had conducted research into the vitamin standards and had recently published tables showing the nutritive value of many foodstuffs commonly available in India Indian agricultural policy was being directed towards the increased production of milk Even China distracted land that it is spoke of progress in this field The majority of the population of China, said its delegate were probably permanently undernourished Their diet was mainly vegetarian and as compared with that of Europeans deficient in animal proteins in vitamins A and D and probably also in vitamin B Last year the Chinese Government set up a national nutrition institute in which were being studied such subjects as dietary standards in institutions and among industrial workers, the nutritional requirements of mothers and school children and the training of public health officers teachers and nutrition experts to spread knowledge regarding sound nutrition He promised that the results of these studies would be communicated to the League in due course

The League has now completed its work on nutrition, but will continue to take a fatherly interest in the movements in the different countries If all that was said in the discussion is to be taken at its full value the world will soon be flowing with milk and honey The pity is that the flow should be menaced by tragic interruptions which Geneva seems powerless to prevent.

pig liver and to infective blood from human patients Further studies, prosecuted by the Institute failed to demonstrate the presence of cultivable bacteria leptospirae, rickettsiae, or protozoa in infective guinea pig tissues The agent was found to be filterable with difficulty through relatively permeable gradocol membranes The reactions of other animals were then tested The rhesus monkey reacted with a well marked fever, and its blood during the febrile period was infective to guinea-pigs In mice inoculated intraperitoneally although the infection rarely proved fatal, marked enlargement of the spleen occurred together with moderate enlargement and distinct histological changes in the liver Rickettsial bodies were observed in sections and smears of enlarged spleens situated in the cytoplasm of cells in the splenic pulp, forming rather sharply outlined microcolonies of closely packed organisms

Subsequent studies showed that the infective agent in mouse spleens was identical with that in guinea-pig liver After many mouse-to-mouse passages enlarged spleens were sent frozen by air to Brisbane These produced typical fever in normal guinea pigs but none in guinea-pigs immune to another strain of the infective agent, obtained initially from a different patient Thus the available evidence tends to incriminate the rickettsiae as the actual infective agents So heavy is the infection in mouse spleens that it has been possible to secure by differential centrifugation emulsions with large numbers of rickettsiae and very little tissue debris Preliminary experiments indicate that these emulsions are specifically agglutinable by convalescent sera from guinea pigs and a monkey and by one of two convalescent sera from human cases of Q fever at present available It is suggested that this indication if established by further studies should furnish a valuable means for the epidemiological investigation of the human disease

Correspondence

Spinal Anaesthesia for Caesarean Section

SIR —In my book on *Caesarean Section* (1927) I stated that I had never employed spinal anaesthesia in cases of Caesarean section, on account of the increased risk to the mother which it entails During the last ten years many cases have been published in which death or severe disabilities—meningitis paralysis severe headache, etc —were due to this method of treatment In the July number of the *Bulletin de la Société d'Obstétrique et de Gynecologie de Paris* (p 588) two cases are described of low Caesarean section in young healthy women in which fatal syncope occurred within one to three minutes of the spinal injection In the discussion of the cases it was stated that Professor Brindeau and Professor Brouha had had several fatalities and that the latter had in consequence abandoned spinal anaesthesia in cases of Caesarean section Professor Voron alluded to the special bulbar sensibility of women in labour to the action of cocaine compounds and added

Undoubtedly we ought to give up the employment of a mode of anaesthesia which otherwise possesses such incontestable advantages" De Lee (*Obstetrics* 1933 p 319) writes Krönig said spinal anaesthesia is dangerous in pregnancy and labour and present experience with all the drugs sadly confirms this Winter and Halban (*Lehrbuch der Operative Geburtshilfe* 1934) also call attention to the danger of spinal anaesthesia in women who are pregnant or in labour for general practitioners the question of its use does not arise For the foregoing reasons I was sorry to find, in Dr H K Ashworth's important article on spinal anaesthesia (*Journal* October 2, p 671) *Caesarean section given as an indication for that method* of anaesthesia which the eminent obstetricians mentioned *have concluded should be abandoned* in favour of general or local anaesthesia for this operation —I am, etc,

London W 1 Oct 2 HERBERT R SPENCER.

Pernicious Anaemia and Diabetes Mellitus

SIR —The two cases of pernicious anaemia and diabetes mellitus described by Dr H G McGregor (September 25 p 617) are of interest since this combination is relatively uncommon

In 1933 I reviewed my series of cases and suggested then that the combination was most possibly a coincidence Since then I have observed in a series of nearly one thousand cases of pernicious anaemia thirteen definite examples of diabetes mellitus coexisting in the same individual while two others are known to have had intermittent glycosuria for many years Of the thirteen patients six were males aged between 34 and 65 years and seven were females aged between 45 and 66 years Pernicious anaemia was first diagnosed in six patients two months one and a half three and a half four four and a half and six years respectively before the diabetes mellitus, symptoms of diabetes mellitus were first noted in four patients, one five ten and twenty six years respectively before the pernicious anaemia while in the remaining three the two conditions were diagnosed simultaneously

The hereditary factor may be of some significance, since I have often noted not only the occurrence of pernicious anaemia or subacute combined degeneration of the spinal cord in different members of one family but also families in which other members have had diabetes mellitus microcytic anaemia or simply achlorhydria (Wilkinson and Brockbank *Quart J Med* 1931 **24**, 219) Achlorhydria appears to be the most frequent common factor in the two conditions, since it is almost invariable in pernicious anaemia and Dr T H Oliver and I found that it was present in a large percentage of diabetics—an observation that has been noted by others Since the majority of cases of pernicious anaemia are first diagnosed between 40 and 60 years of age it will be interesting to follow up from this point of view the large number of diabetics now in that age period as a result of the highly successful modern diabetic treatment Particular attention should be paid to those diabetics with achlorhydria and with diabetic neuritis

The treatment of patients with pernicious anaemia and diabetes mellitus does not present any greater difficulties than may occur in the separate diseases Each disease can be treated adequately in the appropriate manner without interference from the second treatment, and my experience is that less insulin may be needed while greater amounts of anti anaemic substances are unnecessary With increased—almost normal—expectation of life for patients with pernicious anaemia it is now necessary to remember that they may develop other diseases to which the normal individual is liable Consequently changes in the character or an apparent return of the symptoms when taking adequate treatment must be investigated carefully—thus, a sudden loss of weight may indicate diabetes mellitus neoplasm phthisis, thyrotoxicosis etc all of which have been noted although not often in my series during the last nine years —I am etc

sary in the vast majority of operations for toxic goitre, and their routine use appears to us to add a needless hazard to the procedure We recognize that they may be necessary for some patients with non toxic obstructive goitres —We are, etc.,

C Langton Hewer
Geoffrey Keynes

London Oct 4

Sir —Although Professor R E Kelly and Mr Cecil Joll are well satisfied with their results with endotracheal anaesthesia for thyroidectomy that is not the experience of many competent authorities in England and abroad Hewer's *Recent Advances in Anaesthesia* and the text-books published by Ross and Fairlie Nosworthy, and the Baker Institute, Melbourne are unanimous in stating that an endotracheal tube is best avoided in thyroidectomy These publications represent a very wide circle of opinion, and my own modest experience has led me to believe that it is true

I congratulate Professor Kelly on being the first to introduce endotracheal anaesthesia into England but I am surprised that he should be so prejudiced against modern inhalation methods which are now so universally accepted Nothing could approach normal physiological conditions more nearly than the wide bore Magill tube which merely prolongs the trachea to the surface and eliminates the gateway of the glottis

Professor Kelly permits himself to err when he refers to our machinery as cumbersome and he seems to be uncertain as to the function of the bag in the circuit—which leads me to wonder what method he has devised for giving cyclopropane —I am, etc,

London W 1 Oct 5 Ivor Lewis

Adult Serum in Measles

Sir —I was interested in the paper by Sir Kaye Le Fleming in your issue of September 25 (p 612) where he describes the treatment of an epidemic of measles in a public school by adult serum Some of his remarks call for comment

Ever since the days of Francis Home (1719–1813) workers have been attempting to prevent or modify measles with varying success Of recent years, however it has been established that an attack of measles can be prevented or attenuated by the use of a suitable dose of convalescent measles serum or even adult serum This has long passed the experimental stage, and is now recognized as the established procedure in measles control Nicolle and Conseil (1918) showed that the serum of children convalescing from measles could confer protection on an exposed susceptible and this advance was soon put on a definite basis by work both in America and in this country As long ago as 1927 Dr F B Smith and I published an article on the prophylaxis of measles with convalescent serum Since then I have used both convalescent measles serum and adult serum on several occasions in school epidemics of measles and can vouch for its efficacy in prevention when this is desired or attenuation in suitable cases Among other publications I would like to call Sir Kaye Le Fleming's attention to papers by Burnet (1935) on the attenuation of measles by adult serum Hobson (1934) and Elkington (1936) which deal specifically with the control of measles epidemics Hence it is hardly accurate to claim that his is the first occasion on which adult serum treatment has been used in a public school

It is interesting to note that there was no evidence of temporary immunity among susceptibles resulting from the use of adult serum This is in marked contrast with what may be expected from the use of convalescent measles serum given before the sixth day from exposure I am so impressed with the uniformly good results obtained by the use of convalescent measles serum that I always carry a stock, and each time I have had occasion to use it I have been increasingly impressed with its effectiveness in prevention or attenuation of the disease and avoidance of complications

For some time now it has been my practice in school epidemics of measles to divide the susceptible children into two groups those who are poor risks and who should be given serum at once, aiming at prevention and those who are healthy and in whom attenuation rather than prevention is desired —I am, etc,

Indications for Induction of Abortion

Sir —Mr E A Butterworth's letter (*Journal* September 25, p 635) raises an important question I feel, however that he has been unfortunate in the choice of his second illustrative case Within recent years the advisability of induction of abortion for tuberculosis has received considerable attention the conclusions reached are admirably surveyed and summed up in F J Browne's *Ante natal and Post-natal Care* Who is to decide whether induced abortion is necessary in any particular patient? If it is the patient's doctor the obstetrician becomes merely the tool for the purpose of the operation and his wider prognostic experience is valueless If the consultant's view opposes that of the practitioner, the latter may refer his patient to a further specialist for the confirmation of his opinion

It is absurd to say that advice is given in accordance with rules The consultant has to consider what treatment will best serve the interests of the patient, and the patient must be advised accordingly I know of few obstetricians who hesitate to perform induction of abortion if it be warranted On the other hand patients are constantly referred to obstetricians for the termination of pregnancy when the indications are slight or non existent No doubt in many of these cases there is some domestic indication but in, the absence of a definite pathological condition—rendering the continuance of pregnancy more hazardous than the risk and difficulties attending abortion —the majority of obstetric specialists hesitate to advise the latter course Until the indications are extended to include unwanted pregnancies —and I hope this may never come to pass—a great deal of unnecessary suffering often mental can be alleviated by the patient's doctor who should be responsible for her instruction in contraception or should advocate voluntary sterilization in suitable cases

Finally I would point out that it is unjustifiable for a doctor to assure his patient before her visit to the consultant that abortion is to be induced If the consultant does not concur in the view that termination of pregnancy is necessary the patient will be annoyed either with her doctor or with the specialist, according to her own desires concerning the pregnancy and the reputation of either may suffer through the nimble tongue of a dis

of the eyelids and usually a hot fomentation over the affected lid reduces its action to a minimum It is the movement of the facial muscles that presses on the inflamed venules and squeezes out from them septic emboli infecting the cerebral veins—I am, etc,

London E 1 Sept. 25 N Pines

Sulphanilamide in Gonorrhoeal Infections

Sir—In a letter published in the *Journal* of September 25 (p 636) Mr Morton Whitby describes a system of treatment of gonorrhoea, which has, he states enabled him to proclaim a cure between the fourth and eighth week The difficulty of assessing cure in this disease is of course notorious It would therefore be of value to know what tests of cure he has employed He mentions the use of urethral instillations of a mercurochrome solution massaged into the bladder It is not easy to understand how a solution can be conveyed from the urethra to the bladder by massage Are these instillations given into the anterior or posterior urethra? Gonococcal infection of the bladder is not very common, and this makes it difficult to understand the rationale of this procedure

Mr Whitby also deplores the fact that ultra short wave therapy is not available for poor patients at any of the clinics in this country This method was introduced at the Seamen s Dispensary at Liverpool some two years ago while I was a junior assistant there and was extensively used in the treatment of acute epididymitis and prostatic infection—I am, etc,

Salford Sept 30 R C Webster M D

Nutrition in the Falkland Islands

Sir—Dr Arbour Stephens s letter in your issue of September 13 draws attention to the responsibility of Great Britain for the general care and nutrition of those in outlying colonies in which trade and communications make living difficult and unsatisfactory for often diminishing numbers of inhabitants

During a recent spell of general practice in one of the northernmost islands of the Shetlands I have had the chance to observe the conditions under which the people there are obliged to pass their lives There also the teeth of the children of pre school age are rotten and their resistance to gastric and respiratory diseases is low But what struck me most of all was the large incidence of a type of neuritis which I attributed to a dietetic insufficiency chiefly of vitamin B, Administration of this vitamin caused a marked improvement in a number of the cases But I concluded that education was the only satisfactory method of tackling such a number of cases—being even more necessary in these districts than on the mainland where restriction of choice in diet was not so marked

Surely in conditions where amount and variety of diet is restricted both on account of the limited communications and the poverty of the inhabitant a great deal of good could be produced by an elementary knowledge of dietetics—I am etc,

Edinburgh Sept 25 M Spencer Harrison

Sir—In his letter published on September 25 (p 636) Wing Commander Stanley Turner doubts the diagnosis of influenza by Dr Cheverton the M O on the spot and offers some imaginative one as an alternative In order to drive his arguments home he quotes a ship surgeon who writing in 1769 described the soil as fine black earthy This description differs greatly from the report of Sir John Orr, wherein we read that the soils are acid, the nitrogen high, but not utilizable In the report to the Colonial Office (kindly lent me by Mr Ormsby Gore the Colonial Secretary) we are told the best cows give only two gallons of milk, the majority give much less, in the cattle tuberculosis is rife and the stock through inbreeding is very puny Dr Turner states that the cattle are fat fertile and good milkers The people are is hardy as the animals Dr Turner tells us although the Colonial Office report states there is a considerable amount of ill health—for example, nervous debility amounting almost to mental lethargy—possibly due to disturbance of the calcium phosphorus ratio and vitamin deficiency

In the report one finds that appendicitis is a common disease but then Dr T P Binns states (*Journal* p 637) It was fashionable to have the appendix out A statement of this sort is not complimentary to his successor who removed the appendix because of present day fashions on the Falkland Islands! Dr Binns admits the teeth were poor, but they took little care of them and their ideas of infant feeding were not calculated to help the growth of healthy teeth It would be interesting to know why Dr Binns was not able to improve matters if it merely meant educating these hardy people

Nasal catarrh and bronchitis are very prevalent and asthma incidence is high but now that the medical profession has been informed by Dr Turner that this asthma is due to the large amount of mutton eaten we shall see what we shall see—I am, etc,

Swansea Sept 26 G Arbour Stephens

Education in Food Values

Sir—Viscount Dawson of Penn told the House of Lords that malnutrition or, as he preferred to call it undernutrition was largely due to lack of education in the choice and cooking of food, and went so far as to suggest a panel of travelling teachers to instruct housewives how to buy and how to cook food Dame Louise McIlroy (*Journal* August 7, p 258) repeated the old story of white bread and shops stacked with tinned foods and asked how many ante natal clinics or hospitals concerned themselves with lessons in the preparation of foodstuffs Further she inquired whether rural institutes gave demonstrations in food expenditure and values

No doubt all these expedients are good but I venture to inquire whether it ought to be the duty of clinics or hospitals or peripatetic teachers to give this instruction We have had sixty-seven years of primary education in Great Britain and Ireland, and in these years have grievously failed in the important function of teaching our people how to feed themselves The Education Department receives well merited praise for supplying free milk and meals to deserving cases but does it get due credit for having permitted the present state of malnutrition or undernutrition so largely due to defective training to develop?—I am etc

Sept 6 M D, F R C P

Foreign Body in the Rectum

Sir—I read Dr C P Warren s letter (September 25 p 638) with some interest It is a common practice among fishermen who catch eels with hooks not to bother taking out the hook if it has been gorged as it kills the eel They therefore cut the line leaving the hook inside It was only recently that I remarked on the possible danger of this practice and suggested that it was curious that cases of the hook being swallowed were not

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

273 Symptomatic Steatorrhoea

E. LUNDSTEEN (*Hospitalstidende* June 22 1937, p 698) points out that Thaysen applied the collective term of idiopathic steatorrhoea to the conditions hitherto known as coeliac disease and tropical and non tropical sprue respectively Such idiopathic steatorrhoea or Gee–Thaysen s disease must be distinguished from what the author calls symptomatic steatorrhoea two cases of which he reports from Professor Meulengracht s hospital in Copenhagen The first patient was an unmarried woman, aged 52 who presented all the cardinal signs of Gee–Thaysen s disease, including sprue-like motions great emaciation, stomatitis hypocalcaemia with tetany pigmentation of the skin, anaemia and a flat blood sugar curve The post mortem examination however, revealed carcinosis of the small intestine, with innumerable flat white tumours ranging in size from a pin s head to an almond They were confluent at some points and isolated at others There was no enlargement of the mesenteric glands The high fat content of the motions was probably due to the stasis in the intestinal lymphatic vessels caused by the malignant growths The second patient was a married woman aged 24, who, after a normal pregnancy and confinement, developed steatorrhoea, marked hyperchromic anaemia glossitis, latent tetany, and a flat blood sugar curve She became very emaciated, but recovered completely in response to blood transfusions and from two to three months treatment with stomach and liver preparations

274 Serum Sickness in Typhoid Fever

B JOCHWEDS and A SZTEJNBERG (*Monde med* Paris, July 1, 1937 p 779) treated forty one cases with large doses of normal horse serum during the typhoid epidemic at Warsaw in the autumn of 1934 Two injections of from 60 to 80 c cm were given with one or two days between each and serum sickness developed in seventeen, or 42 per cent In four cases it occurred in convalescence without having any effect, and in another four it did not modify the course of the disease In the remaining nine the termination of the attack of typhoid coincided with the appearance of serum sickness which in no way aggravated the attack of typhoid The serum sickness itself was treated by injections of 10 per cent calcium bromide twice a day either alone or in combination with subcutaneous injections of adrenaline

275 Cardiac Effects of Uterine Myomata

H DIETEL (*Dtsch med Wschr* July 30 1937 p 1186) has investigated eighty cases of myoma of the uterus at the University Maternity Hospital in Hamburg Eppendorf with special reference to the theory that this condition has an injurious influence on the heart As many as sixty two of these patients were between the ages of 30 and 50 and eighty further patients of approximately the same age who were suffering from various other gynaecological ailments served as controls Both groups were subjected to the same tests the blood pressure was measured electrocardiographic records were taken and the basal metabolism was estimated The blood pressure measurements were repeated in each case so that a complete graphic record could be obtained and the results were found to be approximately identical for the two groups On the other hand the electrocardiograms showed a much higher rate of abnormalities in the cases of uterine myomata than in the control group In the first group there were as many as twenty-eight patients showing slight electrocardiographic abnormalities and six showing serious abnormalities, whereas among the controls there were only sixteen with slight and four with serious abnormalities The basal metabolism also was more often abnormal in the cases with myomata there were only twenty-two of these patients with a basal metabolism ranging from normal to 10 per cent above it, whereas there were forty seven with a basal metabolism raised by 10 to 20 per cent and eleven in which it was raised by more than 20 per cent In the control group there were as many as fifty three patients with a basal metabolism ranging from normal to 10 per cent above it, twenty four in whom it was raised by 10 to 20 per cent, and only three in whom it was more than 20 per cent above normal The author concludes that the constitutional disturbances from which many patients with myoma of the uterus suffer may well be due to a disordered function of the thyroid gland

Surgery

276 Total Thyroidectomy in Cardiovascular Disease

R SINGER (*Wien klin Wschr* July 9, 1937, p 1025) reports a number of cases of cardiovascular disease in which, after all medical treatment had failed considerable improvement was obtained following total thyroidectomy The results were good in myocardial disease as well as in angina pectoris The author elaborates the theoretical basis of the operation, which should be limited to cases of chronic decompensated hypertony which do not respond to digitalis and strophanthin therapy, and to non progressive angina pectoris which remains uninfluenced by the usual therapeutic measures In no case was the operation followed by cachexia strumipriva, in fact most of the patients felt much brighter after the operation

277 Common Duct Obstruction

I S RAVDIN and W D FRAZIER (*Surg Gynec Obstet* July 1937 p 11) discuss the effects of obstruction of the common bile duct on the cytology of the liver cells and on the portal blood flow It has been seen that when the duct becomes obstructed the liver cells continue to secrete bile until the intraductal pressure reaches the same level as the secretory pressure of the liver If the gall bladder is capable of absorption bile may be secreted for hours but if it is badly damaged the intraductal pressure may rise so abruptly that secretory suppression of the liver occurs in a few hours As the liver cannot be distended to any great extent the intrahepatic ducts dilate at the expense of the hepatic cells and blood vessels the portal venous circulation suffering most The arterial circulation also becomes affected and hepatic anoxaemia results Portal venous stasis causes stagnation of the blood in the intestinal tract and leads to an increase in the blood volume in this part of the circulatory system and a decrease in the circulating blood volume The bilious ascites which follows common duct obstruction is due to the rise in pressure in the capillaries Intense hyperaemia occurs when a complete obstruction of the ducts is relieved and may cause damage to the liver cells and changes in circulation A method of gradual decompression is described which has been in use for several years The apparatus is illustrated and shows how by means of a Y tube the flow of bile can be regulated Enough is obtained externally for analytical study, and the rest is forced down into the duodenum by controlling the level of the Y tube The pressure within the decompression apparatus should only be sufficient to overcome the tonus

BOROUGH OF SOUTHALL

APPOINTMENT OF MEDICAL OFFICER OF HEALTH

The Council invite applications for the above appointment from duly qualified and registered Medical Practitioners who in addition to the qualification prescribed by any Statute are also registered in the Medical Register as holding a Diploma in Sanitary Science, Public Health or State Medicine

The appointment will be subject to the provisions of the Local Government Act 1933 the Sanitary Officers (Outside London) Regulations 1935 and the approval of the Minister of Health

The person appointed will be required to perform all the duties imposed on a Medical Officer of Health under relevant Acts and Orders to act as Medical Officer to the Maternity and Child Welfare Centres and Medical Superintendent of the Isolation Hospital so long as this continues to be maintained by the Council and will also be required to carry out such other duties of a like nature as the Council may with the consent of the Minister of Health (where necessary) from time to time direct

The person appointed will be required to reside within the Borough and to devote his whole time to the duties of the office He will not be permitted to engage in private practice.

The inclusive salary attaching to the office will be £800 per annum rising (subject to satisfactory service) by annual increments of £50 to a maximum salary of £1 000 per annum together with a car maintenance allowance of not less than £50 per annum

All fees receivable in respect of any duties carried out by the Medical Officer of Health must be paid into the Council's accounts

The Local Government and Other Officers Superannuation Act 1922 has been adopted and the above-mentioned post designated for superannuation purposes and the successful candidate will be required to pass a medical examination by the Council's Medical Officer of Health and to contribute to the Council's Superannuation Fund

The person appointed will be required to give three months notice to determine the appointment

Applications stating age qualifications and experience accompanied by copies of three recent testimonials must be delivered to the undersigned not later than October 25th 1937

The canvassing of any member of the Council by or on behalf of any candidate for the above-mentioned appointment is prohibited and will result in the disqualification of that candidate and each candidate is required to state in his application whether or not he is related to any member or Chief Officer of the Council

THE ROYAL INFIRMARY BRADFORD

It is proposed to create the post of DERMATOLOGIST to the Bradford Royal Infirmary The successful applicant must reside in Bradford and practise solely as a Dermatologist

Applications and copies of recent testimonials are to be sent to the undersigned on or before October 22nd

H TRUSSON
House Governor and Secretary

glands were demonstrable there were eleven patients, ten of whom were still symptom free In a third group which contained seventeen inoperable cases, there were only three patients who had become symptom free under treatment with radium The authors insist that these figures underline the enormous importance of giving cancer of the lip radium treatment as early as possible

284 X-Ray Treatment of Cancer of the Rectum

E Bandier (*Ugeskr Laeg* July 1, 1937, p 714) endorses with certain reservations the general opinion that the radiological treatment of cancer of the rectum is palliative rather than curative At the Radium Station in Copenhagen, in the period 1931 to 1934 the admissions for cancer of the rectum numbered 142, but only nine of these cases were considered operable In 125 cases x ray treatment only was given with a supplementary colostomy being performed in a few instances There were forty-three deaths during the first year after treatment, thirty-nine during the second year fifteen during the third year, eight during the fourth year, and three during the fifth year None of the patients who died showed at any *time signs of clinical recovery, and in almost every case* the cause of death was cancer of the rectum In the eight cases in which the immediate cause of death was other than cancer, the tumour of the rectum showed no regression The author gives details of five cases in which, after microscopical verification of the diagnosis, clinical recovery was achieved under treatment by *x* ray therapy alone The observation period was three years in two cases and five in three An attempt was made to ascertain what were the factors governing the recovery in these five most exceptional cases but they appeared to be quite ordinary instances of adenocarcinoma of the rectum Recovery could not be ascribed to any novel departure from conventional x ray treatment of cancer of the rectum The author concludes that while x-ray treatment is incomparably inferior to operative treatment in operable cases these five recoveries justify further close study of x ray treatment for this condition

285 X-Ray Treatment of Blood Diseases

J Ducuing P Marques and O Miletzky (*J Radiol Electrol* June, 1937, p 250) have treated by means of total radiotherapy eleven cases of which there were five of Hodgkin's disease, five of myeloid leukaemia, and one of lymphatic leukaemia. They irradiated the whole body by means of two x ray tubes energized simultaneously They gave a total maximal dose of 300 *r* units in three to four weeks the maximum dose at a sitting was 25 *r* units and the applications were given every second or third day During the course of treatment the blood should be closely watched as the danger of the treatment lies in the possibility of causing a leucopenia or thrombopenia rather than an anaemia Leucopenia usually does not arise in lymphogranulomatosis and in leukaemia The anaemia which is always present in these cases does not constitute a contraindication to total radiotherapy in fact it is often improved by the treatment Thrombopenia is more serious and no cases showing less than 100 000 thrombocytes per c mm should be subjected to the treatment Cases of lymphatic leukaemia are particularly prone to develop anaemia and leucopenia as a result of the treatment

286 Cerebral Changes Due to Radium

H A Colwell and R J Gladstone (*Brit J Radiol* July 1937 p 549) have exposed the brains of living rats to gamma rays of radium and have observed a number of non suppurative inflammatory changes The immediate effects of the irradiation were vascular engorgement and changes in the nerve cells mainly in the larger cells of the cerebral and cerebellar cortex With the lapse of time no attempt at repair was observed on the contrary, the degenerative changes in the cells were progressive The histological changes were similar to those occurring in the neighbourhood of haemorrhages or mechanical injuries after death The vascular dilatation which followed immediately after irradiation was accompanied by an escape of red blood corpuscles The initial stages of inflammation of the cerebral membranes were accentuated at twenty four hours after irradiation The inflammatory reactions which were observed in the earlier stages increased progressively with the lapse of time and were attended by disintegration and total destruction of nerve cells occasional haemorrhages into the nerve tissue and cerebral ventricles, and the appearance of necrotic patches due to contraction of the arterioles

287 Cancer of the Cervix

J C Ahumada O Prestini and J del Togno (*Zbl Gynäk* July 10, 1937, p 1639) review the results of radium therapy in 607 cases of carcinoma of the uterus *in which the Regaud technique was used Of these cases* 40 per cent were operable, 53 per cent inoperable and 7 per cent were regarded as hopeless In the operable group a five year cure was achieved in 46 per cent, and in the inoperable cases only in 19 per cent

288 Gastric Mucosa in Relief

R A Arens and S D Mesirow (*Radiology* July, 1937, p 1) describe a method for the demonstration of the relief of the gastric mucosa by means of a new colloidal *suspension of barium in water (Rugar) combined with* the administration of a seidlitz powder The patient was given on an empty stomach the colloidal suspension of barium mixed with water in a proportion of one to fifteen He was then placed in the prone position and told to lie at first for five minutes on his left side then for an equal time prone, and at last for another five minutes on his right side He was then given the seidlitz powders and instructed not to belch Films of the stomach were taken in the right lateral right oblique, and anterior positions The patient was finally given an ordinary barium meal and the radiographs were repeated The authors present a series of thirty cases, in some of which the stomach was normal while in several the examination revealed unusual pathological findings They agree with the Cole collaborators that this sedimentation method cannot be used as a routine to the exclusion of the ordinary barium meal, but they think that it is useful as an adjunct in certain special cases

289 Radiology of Haemoptysis

Schmidt and Unholtz (*Z Tuberk* 78 1-2 p 1) have x rayed 151 cases of haemoptysis mostly of tuberculous origin The patients were photographed in bed immediately following cessation of bleeding and again later when convalescent In one third of the cases no clinical or x ray changes could be found In the remainder shadows due to massive aspiration of blood or secondary inflammatory changes were seen They were of considerable assistance in determining whether the underlying condition was in the process of healing, stationary or progressive Evidence of haematogenous dissemination of tuberculosis was well marked By means of radiographs it was possible to ascertain the course of the disease, its distribution and the course of the *focal* pneumonias following haemoptysis even in the absence of physical signs Changes of non tuberculous origin were only differentiated by the absence of the specific organism

WEST LONDON HOSPITAL, HAMMERSMITH ROAD (239 Beds)

CHIEF ASSISTANT TO THE DEPARTMENT FOR TREATMENT OF INJURIES required. The post is a resident one and the duties commence on NOVEMBER 1st.
